Maximizing impact with scarce resources: Planning difficult choices

Introduction to the economics of malaria intervention choices

Dr. Catherine Pitt
Professor of Health Economics

Session: Maximizing impact with scarce resources

Tuesday, 24 February 2026

SMC Alliance & Alliance for Malaria Prevention Joint Annual Meeting

Kampala – Uganda

LONDON

ECONOMICS
CENTRE

Objectives of this session

In 20 minutes, I cannot teach a course on health economic evaluation!

By the end of this session, I hope you will:

1. Approach difficult malaria intervention choices with an economic mindset:
 1. Clearly frame the choices (options): objectives and scope of costs
 2. Assess options incrementally
2. Critically consider economic evidence
3. Resolve to commission and use high quality economic evaluations to inform decisions

What is (health) economics?

- Economics is the science of **CHOICE**
 - Resources are limited – by definition, everywhere
 - Our “wants” are unlimited – e.g. health for all
 - Choices can be implicit (maintain the status quo) or explicit
 - Choices can be made by individuals or institutions
- Economists are concerned with . . .
 - **Efficiency** – maximising outcomes given scarce resources
 - **Equity** – fairness in the distribution of costs and benefits
 - **Preferences** – respecting individual and institutional values in decision-making
- **Not only** about money!

Asking economic questions

How can we cut our GC8 budget?

Perhaps, but some better questions would be:

How can we minimise the harms of reduced malaria investments?

How can we maximise health and equity with the resources available?

If the resource envelope changes, what interventions should we add, subtract, or change?

How can we advocate for more resources for malaria by demonstrating the efficiency and value of investments in malaria interventions (vs. other investments)?

What is health economic evaluation?

- A systematic comparison of two or more potential **future** courses of action in terms of their expected **costs** and **health effects** – informed by the best available evidence
- A highly developed, codified analytical framework
 - CHEERS reporting checklist (akin to CONSORT)
 - IDSI reference case – methodological specifications
- Widely used:
 - e.g. in Ethiopia and Malawi to support basic health benefits package design
 - In evaluating malaria interventions – but scope for wider use in decision-making

Effect measures determine type of econ evaluation

Incremental cost per . . .

. . . SMC or PMC course delivered, person-year of protection

- Process outcome – no indication of health impact

. . . malaria case averted, reduction in infection prevalence

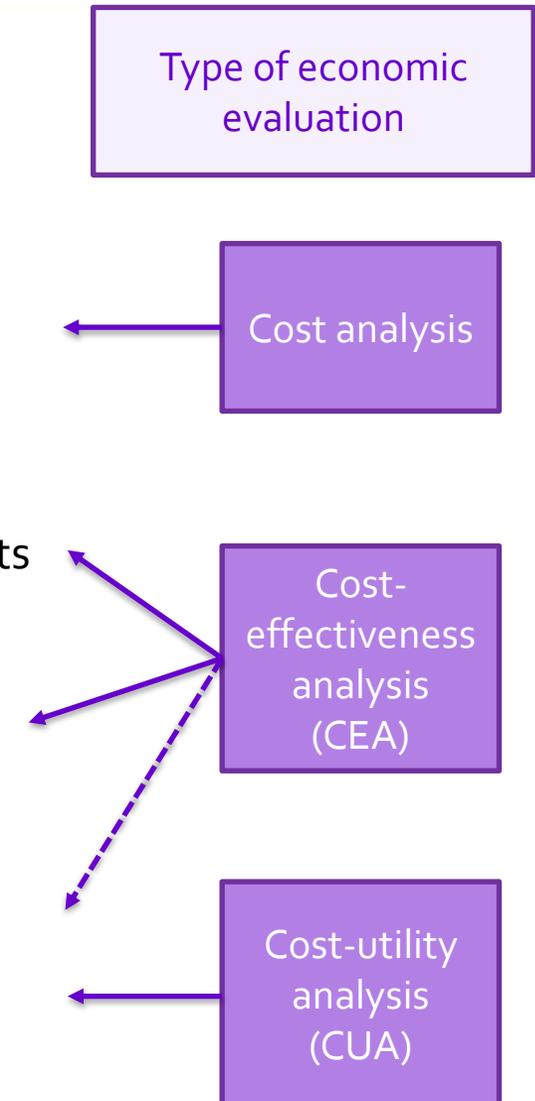

- Intermediate health outcome – disease-specific, not comparable with investments for other diseases

. . . death averted, life-year gained

- Final health outcome – but only addresses mortality

. . . disability-adjusted life-year (DALY) averted, QALY gained

- Combines morbidity and mortality into a single metric
- **Comparable across health conditions**

Key questions
to frame an
economic
evaluation

- 
- 1. Objectives**
 - 2. Options**
 - 3. Costs**

What are the objectives of our malaria intervention package?

Buying products?

Delivering products?

Malaria elimination?

Reducing malaria cases?

Reducing malaria infections?

Reducing malaria deaths?

Reducing malaria DALYs (a measure of cases, disability, and deaths)?

- Objectives indicate the appropriate measure of effect
- Economic evaluation guidelines call for DALYs or QALYs as standard

What are the options?

Define the **interventions – and packages of interventions**

- Who, what, where, when, why, for how long, how often, etc
- A product – a tablet, a bed net – is not an intervention!

Define the **geographical units** for intervention targeting

- What granularity is feasible and acceptable for targeting? Regions, districts, villages?
- Consider diseconomies and data demands in fine-grade targeting

➤ An economic evaluation compares the costs and effects of options *incrementally* with each other

Whose costs and which costs count?

Perspective *Public provider Societal?
(donor+domestic gov't)? Local governments?
Donors? Health insurance?
Domestic governments? Households?

Type of cost

Financial costs = money → important for budgeting

*Economic costs = value of resources → important for guiding choices

Scope of cost

Preventive intervention only?

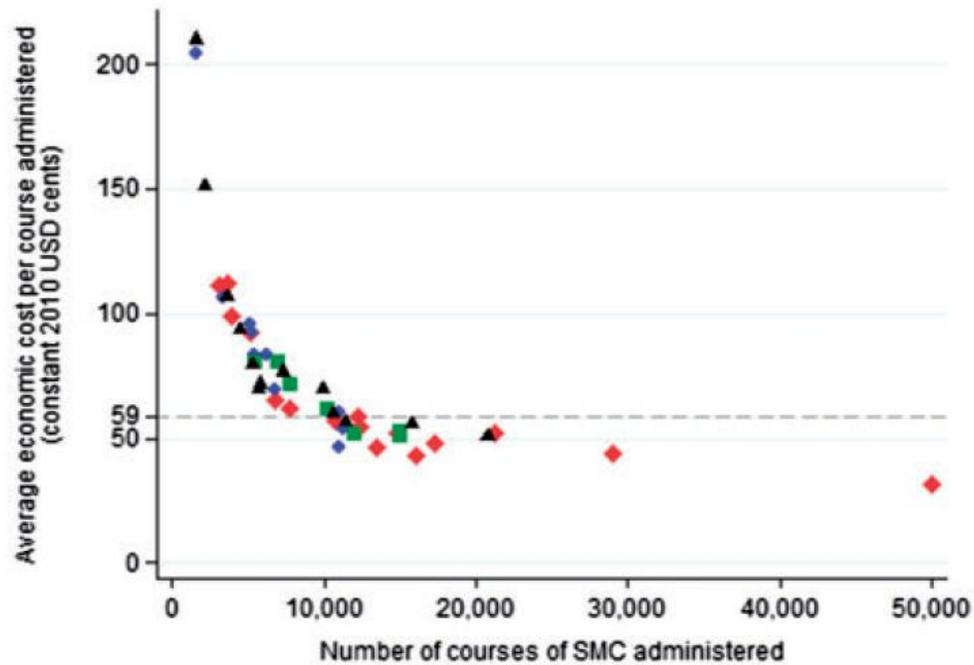

*Intervention + downstream costs of case management

➤ Need to consider all costs that may be different between interventions

What are the signs of a good economic evaluation?

- Clarity about the intervention
- Transparency and appropriateness of scope of costs and effects
- Exploration of variation (heterogeneity) in costs and effects – ideally including cost functions
- Assessment of uncertainty of conclusions
- Adherence to reference case and reporting guidelines

Intervention cost analyses can generate useful insights for planning and innovation to increase efficiency – e.g. economies of scale

Large-scale delivery of seasonal malaria chemoprevention to children under 10 in Senegal: an economic analysis

Catherine Pitt,^{1,*} Mouhamed Ndiaye,² Lesong Conteh,³ Ousmane Sy,² El Hadj Ba,^{4,5} Badara Cissé,^{2,5} Jules F Gomis⁴, Oumar Gaye,² Jean-Louis Ndiaye² and Paul J Milligan⁵

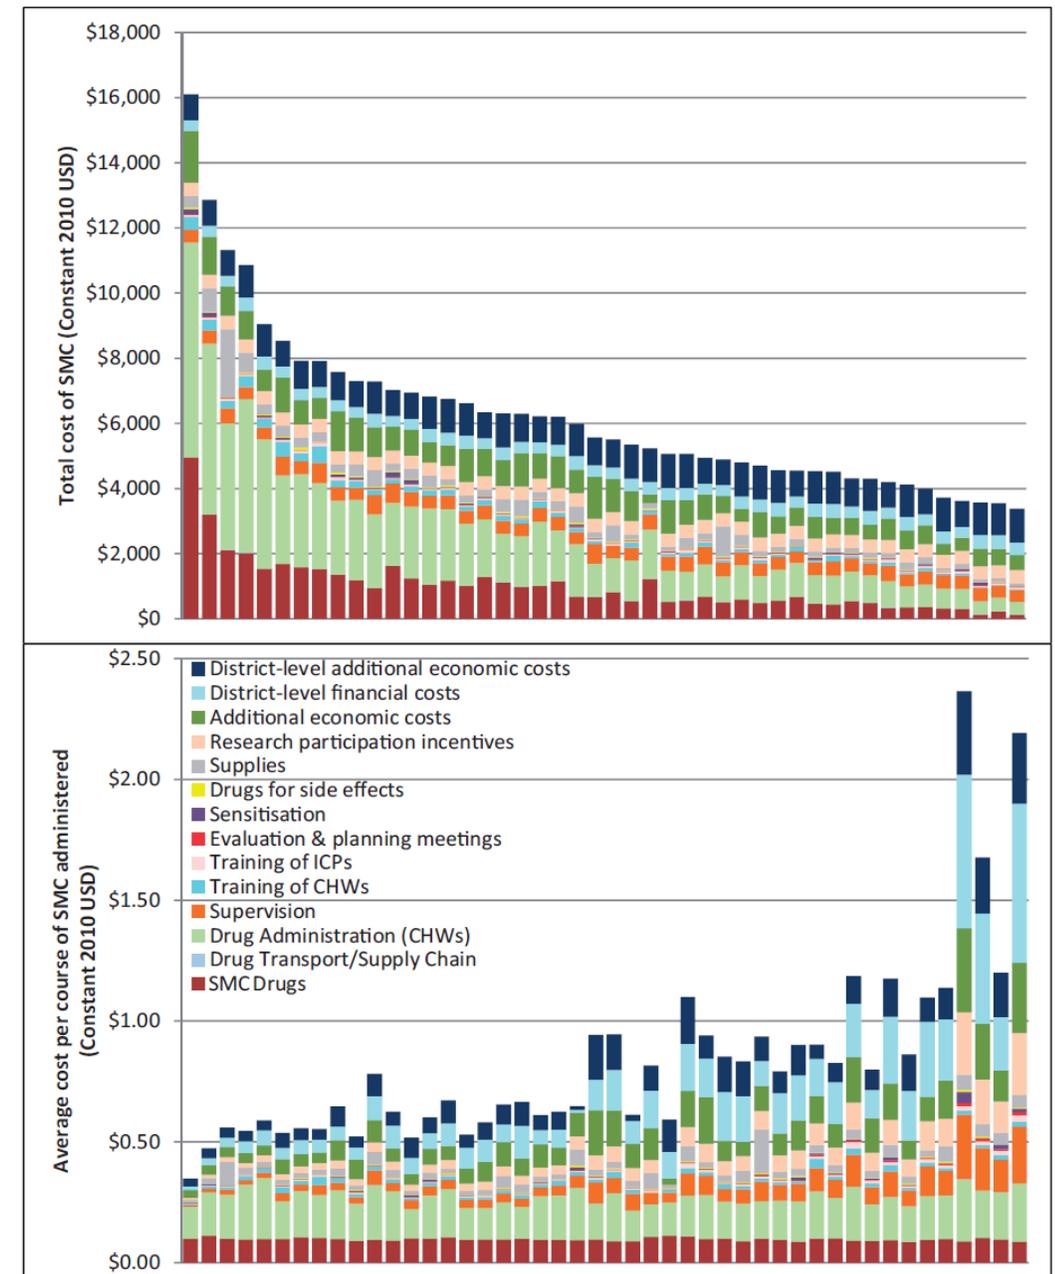

Figure 1. Total and average costs by health post with cost drivers. Health posts are ordered (left to right) in both graphs from largest to smallest total economic costs, including research participation incentives. District-level costs have been divided evenly across the health posts within each district. As total costs decrease, the average cost per course administered tends to increase, although there is some variation in this trend.

Different cost perspectives may produce different conclusions

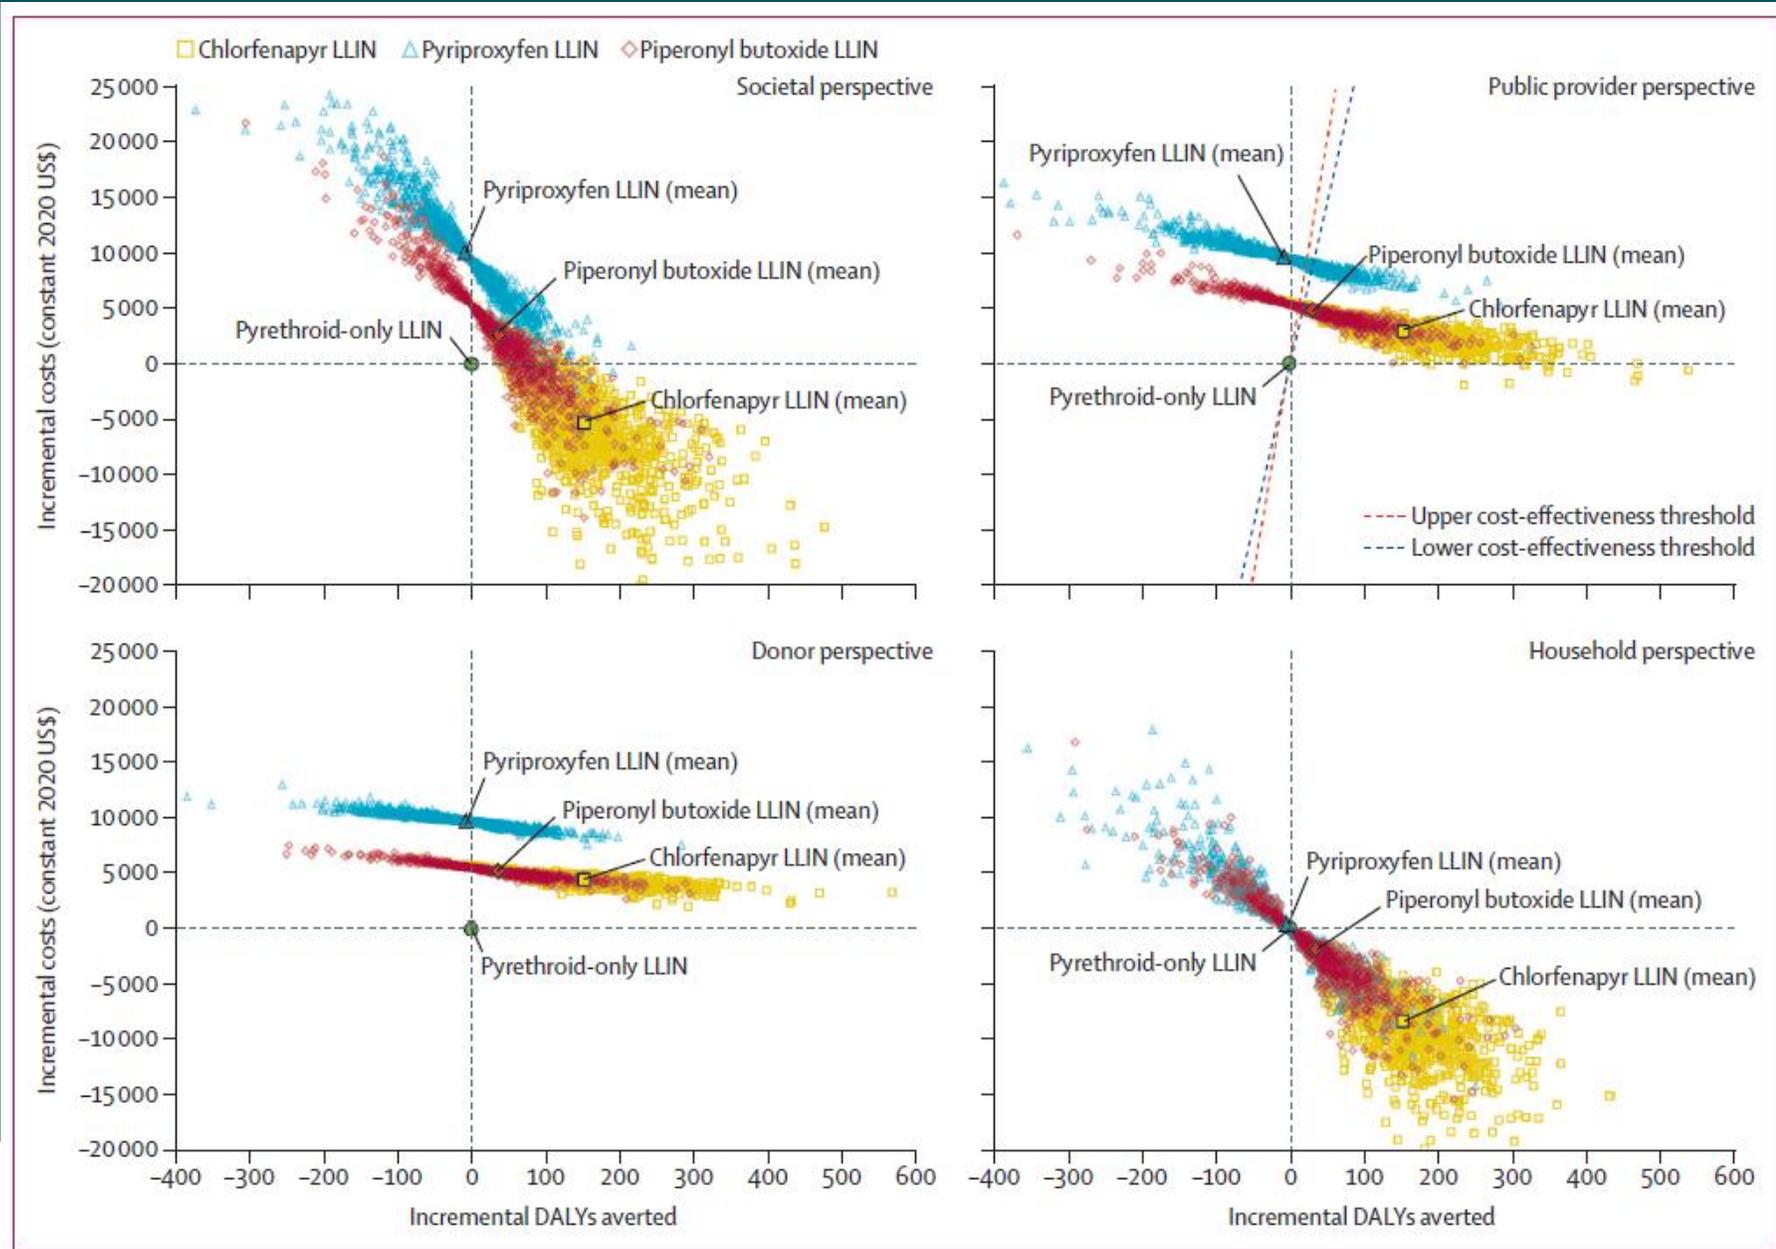

Figure 2: Cost-effectiveness of dual-active-ingredient LLINs relative to pyrethroid-only LLINs over a 2-year period
 Cost-effectiveness planes are shown separately for societal, donor, public provider, and household perspectives. The public provider perspective combines costs borne by donors with costs borne by the public health service in providing LLINs and malaria diagnoses and treatments. Each data point reflects a single iteration in the Monte Carlo simulation; 1000 iterations were conducted. LLIN=long-lasting insecticidal net. DALYs=disability-adjusted life-years.

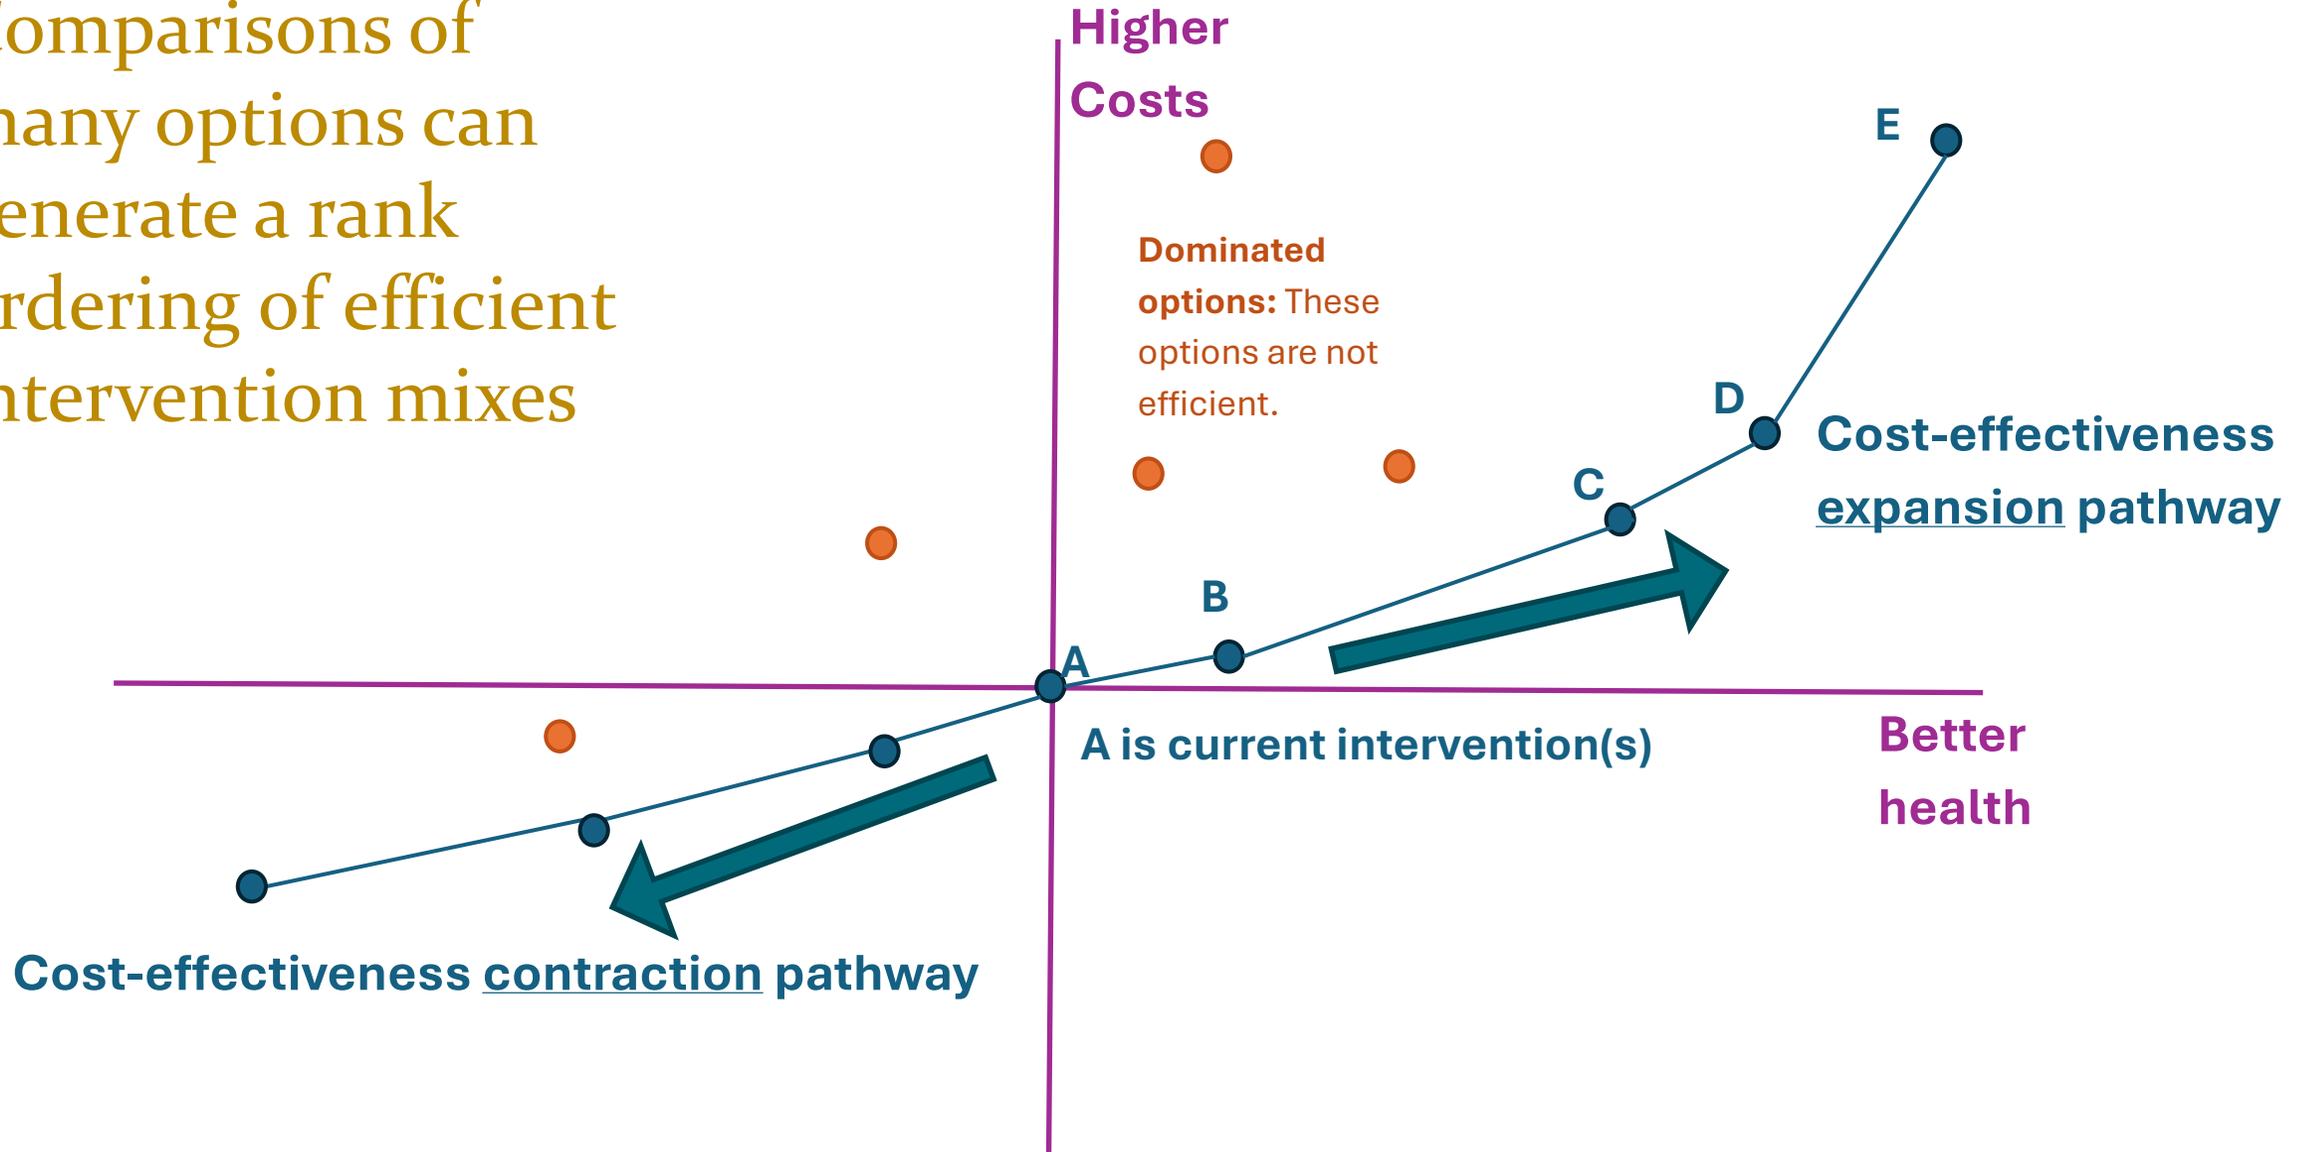

Effectiveness and cost-effectiveness against malaria of three types of dual-active-ingredient long-lasting insecticidal nets (LLINs) compared with pyrethroid-only LLINs in Tanzania: a four-arm, cluster-randomised trial

Ranked prioritisation of PMC delivery options by admin-1 unit

This table shows the ranked prioritisation of PMC options. The first option is the most cost-effective choice. For a given investment, the first option will avert the most deaths. The second option is less efficient than the first option. We compare different delivery schedules to the currently implemented package of interventions in the selected country, and to each other. We then rank the interventions in order in which they should be added to existing malaria control activities in the selected country. This ranking is based on its cost-effectiveness which incorporates health impact and implementation costs. All costs are presented in 2024 USD.

ICERs include economic costs of implementation, with start-up costs annualised at 3% over 7 years. The costs of co-designing a PMC implementation approach specific to country context has not been included.

Interpreting ICERs: If implementation in the first region in a country is shown as not cost-effective, but other regions in the same country are shown as cost-effective lower in the ranking, then it would not be cost effective to implement only in the first region in the country, but it would be cost-effective to implement in the first and second (and potentially more regions) simultaneously.

Objectives of this session (recap)

By the end of this session, I hope you will:

1. Approach difficult malaria intervention choices with an economic mindset:
 1. Clearly frame the choices (options): objectives and scope of costs
 2. Assess options incrementally
2. Critically consider economic evidence
3. Commission high quality economic evaluations to inform decisions

A few final words . . .

- Economic thinking can help decision-makers maximise achievement of their objectives with the resources available to them
- NMPs have access to donor, domestic government, household, and other resources - all should factor into strategic planning and advocacy
- Chemoprevention and vector control can save lives, reduce resource use for case management, and increase productivity – important to consider all these health and economic gains in choosing interventions and advocating for investment
- Greater donor flexibility could allow scarce resources to be used more efficiently – allowing for innovation and adaptation in meeting programme objectives – and to support countries in pursuing their objectives.

SMC Alliance/AMP Annual Meetings 2026

**MAP ITN-CM allocation tool: exploring prevention
and case management under limited resources**

Tasmin Symons

History of tool

**Current
functionality**
(GC7 reprioritisation
use case)

**Potential future
functionality
and use cases**

History of tool: GC7 reprogramming

- May 2025:
 - Major concern about disruption to GC7 funds for planned ITN campaigns in 2025/2026;
 - Countries potentially facing urgent reprogramming under reduced budgets
- Reprogramming raises many questions about optimal strategies and trade-offs
- One potentially common scenario:
 - Maintain case management everywhere
 - Reduce planned ITN distribution (e.g. subnational withdrawal; demographic targeting, household capping)
- This would raise two immediate operational questions:
 - Where should the ITNs be withdrawn? (maximize savings while minimizing cases?)
 - What would be knock-on effect on ACT/RDT commodity needs?
- Partners asked MAP to develop a simple tool to help explore these trade-offs
 - Brought together two pre-existing models:
 - ITN coverage model: predicts coverage trajectory given different distribution scenarios
 - Geospatial prevalence/incidence model: estimates impact of changing coverage on case burden

History of tool

**Current
functionality**
(GC7 reprioritisation
use case)

**Potential future
functionality
and use cases**

We have developed a simple tool which allows users to

- Configure ITN distribution strategies, starting from current planned distributions.
- Quantify the change in ITN volumes required and compare to available/feasible volume.
- Gain insight into plausible change in case management commodity need, relative to current plans.
- Work with MAP to update/refine input data and simulated distribution strategies.

The tool is not a case management quantification tool, nor a forecast.

Given scenarios of ITN volumes, we produce estimated change in malaria cases through a two-step modelling process:

- We generate scenarios of ITN coverage (use) given burn-in distribution volumes, estimated ITN attrition rates, and the scenario volumes
- We estimate impact on malaria cases via MAP *PfPR* and clinical incidence models, given these ITN coverage scenarios.

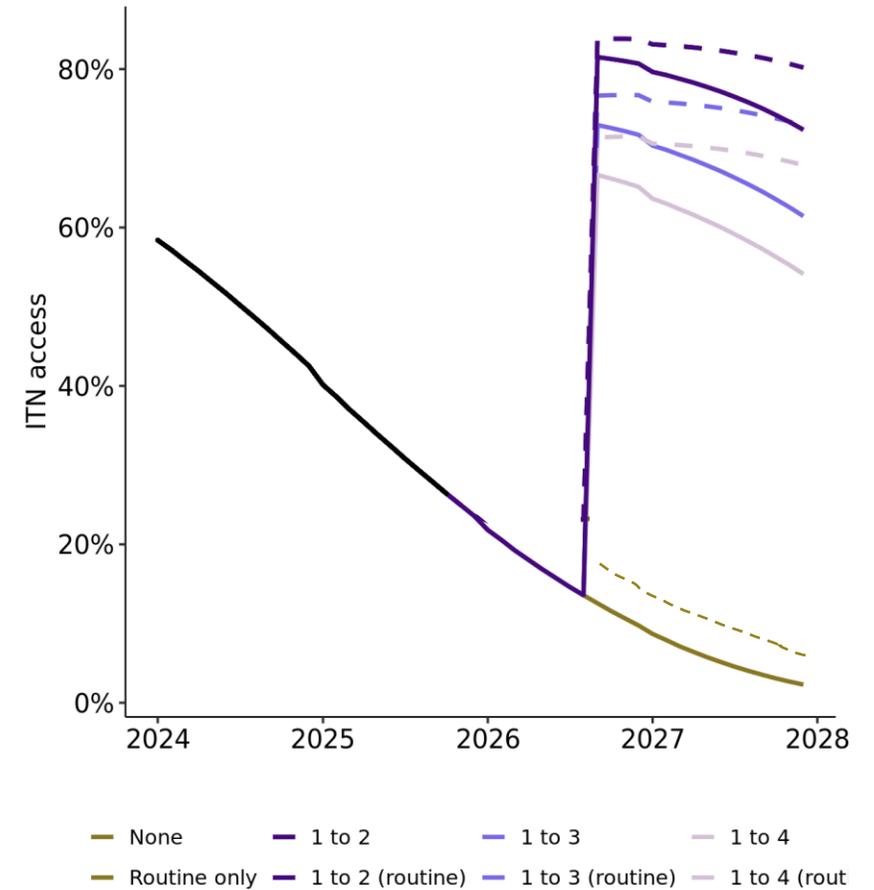

Estimated change in case management need is assumed to **relatively** track change in estimated community-level burden – so e.g. 20% more cases overall means a 20% increase in cases attending health facilities.

After burning in financed ITN distributions to Q2 2025, we simulated a range of possible scenarios of coverage to December 2027 for each Admin2.

Different campaign strategies were simulated according to the table below. In addition to these, routine distribution was simulated.

Number of ITNs by household size

| ITN Distribution ratio | 1 person | 2 person | 3 person | 4 person | 5 person | 6 person | 7 person |
|------------------------|----------|----------|----------|----------|----------|----------|----------|
| 1:2 | 1 | 1 | 2 | 2 | 3 | 3 | 4 |
| 1:3 | 1 | 1 | 1 | 2 | 2 | 2 | 3 |
| 1:4 | 1 | 1 | 1 | 1 | 2 | 2 | 2 |

GC7 ITN reprogramming tool

The screenshot displays the 'ITN Reprioritisation Explorer GC7 (2026)' web application for Liberia. The interface is divided into four main steps:

- Step 1: Define planned commodity need (before reprioritisation)**
 - Define ITN volume before reprioritisation:** Shows 'Needs met' at 3.3 million ITN volume needed. Includes a bar chart and a legend for Routine (purple) and Campaign (blue).
 - Define RDT/ACT quantification (for 2026) before reprioritisation:** Shows 0 RDTs per year and 0 ACT courses per year.
- Step 2: Define ITN volume available for reprioritisation**
 - Input field for 'ITNs available for 2026' is set to 0.
- Step 3: Configure reprioritised ITN strategy**
 - Begin reprioritised ITN strategy from template?** Shows 'Planned strategy' with 3.3 million ITNs required for reprogramming strategy.
 - Refine reprioritised subnational ITN distribution:** Includes a map of Liberia with a legend for Campaign (No/Yes) and Routine (No/Yes).
- Step 4: Review expected impact of reprioritisation**
 - ITN volume required after reprioritisation:** Shows 0 ITNs available and 3.3 million ITNs required, resulting in -3.3 million ITNs remaining (-0%).
 - RDTs demand:** Shows 0.0% for 2026.
 - ACT demand:** Shows 0.0% for 2026.
 - Change in ITN volumes:** Includes a bar chart and a legend for percentage changes from > 50% to < -50%.
 - Select layer:** 'Impact on ITN volumes' is selected, showing a map of Liberia with a tooltip for Saclepea, Nimba state, with a Receptive P/PR of 0.4 and positive impacts on malaria cases, ITN volumes, ACT courses, and RDTs.

GC7 ITN reprogramming tool

ITN Reprioritisation Explorer GC7 (2026)

Define RDT/ACT quantification (for 2026) before reprioritisation
1.5 million RDTs per year | 700 thousand ACT courses per year

Step 2: Define ITN volume available for reprioritisation
2.3 million ITNs available for 2026

Step 3: Configure reprioritised ITN strategy
Begin reprioritised ITN strategy from template? (Descending risk selected)
Planned strategy: Descending risk
Exclude units with completed GC7 campaign:
Routine distribution? (Yes selected) | Mass campaign? (allocation ratio) (1:2 selected)
Exclude urban: | Exclude urban:
2.3 million ITNs required for reprogramming strategy
Your strategy uses 98.5% of the ITNs available

Step 4: Review expected impact of reprioritisation
ITN volume required after reprioritisation: 2.3 million ITNs available, 2.3 million ITNs required, 35 thousand ITNs remaining (1%)
RDTs demand: +2.9% 2026, +1.7% 2026
ACT demand: +6.2% 2026, +3.6% 2026

Given this new volume, a distribution strategy can be based on units ranked by descending risk, until volume exhausted

Step 3: Configure reprioritised ITN strategy ⓘ

GC7 ITN reprogramming tool

The screenshot displays the ITN Reprioritisation Explorer GC7 (2026) interface. The browser address bar shows the URL: `itn-scenario-explorer.malariaatlas.org/countries/LBR`. The interface is divided into several sections:

- Top Panel:** Shows the current country (Liberia) and navigation options like Undo, Redo, Download, Save/Share, and Contact us. It also includes language options (English, Français).
- Left Panel (Step 2):** "Define ITN volume available for reprioritisation". A slider is set to 2.3 million ITNs available for 2026. Above this, it shows "1.5 million RDTs per year" and "700 thousand ACT courses per year".
- Left Panel (Step 3):** "Configure reprioritised ITN strategy". It offers a "Planned strategy" (Stratified by risk) and "Begin reprioritised ITN strategy from template?". It includes settings for Rural and Urban areas with allocation ratios (e.g., 1:4, 1:3, 1:2) and a "Custom" section for specific admin units like Greater Monrovia.
- Center Panel:** A map of Liberia showing subnational ITN distribution. A legend indicates "Campaign" status (No, Yes) and "Routine" status (Yes). A second map shows the refined distribution with a legend for "Campaign" (No Campaign, Allocation ratio 1:4, 1:3, 1:2) and "Routine" (Yes).
- Right Panel (Step 4):** "Review expected impact of reprioritisation". It features a bar chart comparing "Available" (2.3 million) and "Required" (2.3 million) ITN volumes, with 69 thousand ITNs remaining (3%). It also shows "RDTs demand" (+2.3% 2026, +4.9% 2027) and "ACT demand" (+5.0% 2026, +11% 2027). A bar chart below shows ITN volume over time (Q1 2026 to Q4 2027) for Routine and Campaign.
- Bottom Right Panel:** "Select layer" set to "Impact on ITN volumes". A map shows the change in ITN volumes by subnational region, with a legend ranging from > 50% (dark blue) to < -50% (dark red).

Summarised change in distributed volumes, subnationally

Impact is summarised in terms of increased need for ACT/RDT, relative to amounts in user defined quantification.

Impact on malaria cases: +0.0%
Impact on ITN volumes: +0.0%
Impact on ACT courses: +0.0%
Impact on RDTs: +0.0%

History of tool

**Current
functionality**
(GC7 reprioritisation
use case)

**Potential future
functionality
and use cases**

Limitations and future utility

This tool was developed for specific use case, but overall user interface and functionality is generic. It combines two core functionalities:

Coverage modelling:

- Scenarios of ITN distribution volumes translated to population coverage scenarios, accounting for:
 - Pre-existing nets in households
 - Effects of household size on net ownership and use
 - Local ITN attrition rates and use given access

Currently, we do not account for:

- Costings and distribution channels:
 - Scenarios configured by overall input volumes, not budget envelope
 - But there are distribution budget implications for e.g. routine vs mass campaign channels
- Age-structured coverage
 - Targeting achieved by routine channels (i.e. we assume routine nets distributed across whole population)

**Clear pathway to extension
in collaboration with partners**

Impact modelling:

- Epidemiological model converts ITN coverage scenarios into disease burden, accounting for variation in:
 - Efficacy of ITNs, including impact of insecticide resistance and next-generation nets
 - Receptive transmission potential in the absence of vector control
 - Context of other intervention coverages

Currently, we do not account for:

- Age-structured impact, including differential impact of age-targeted distributions
- Changing coverage of other vertical interventions, e.g. SMC

**Longer-term R&D required
in collaboration with partners**

**Discussion - Questions
& Answers**

**Discussion - Questions
et réponses**

**Discussão – Perguntas

CAMEROUN CPS: PLAN D'ATTENUATION POUR SURMONTER L'ORDRE D'ARRET DES TRAVAUX DU PMI/USAID

Présentée par :

Dr ZEH MEKA ALBERT

Secrétaire Permanent, PNLN-Cameroun

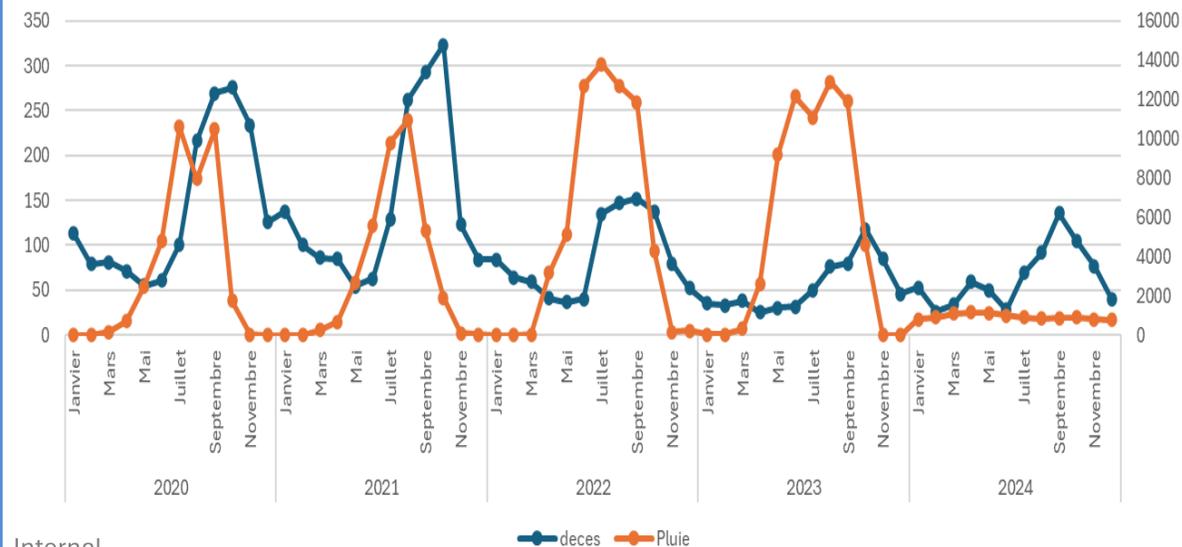

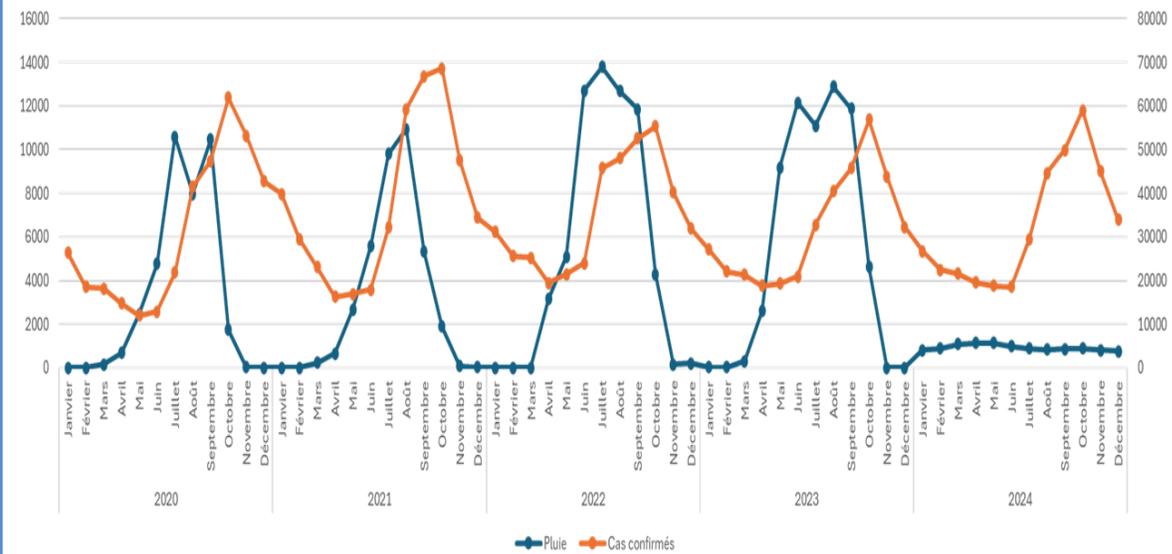

- ✓ Introduction
- ✓ Contexte
- ✓ Mesures de mitigation
- ✓ Leçons apprises & conclusion

Introduction (1/4)

- Le paludisme demeure une **priorité de santé publique au Cameroun**, avec un profil **endémo-épidémique** et de fortes **disparités régionales**.
- Le fardeau est variable selon les régions, liée à des facteurs climatiques, géographiques, et socio-économiques;
- **Groupes les plus affectés** : enfants de moins de 5 ans, femmes enceintes, populations rurales et pauvres.
- **Sud du pays** : transmission **continue** tout au long de l'année.
- **Régions du septentrion** : transmission **saisonnière** (4 à 5 mois), avec la majorité des **cas et décès**, surtout chez les **enfants de moins de 5 ans**.

Introduction (2/4)

Dans les régions de l'Extrême-Nord et du Nord,

- **Corrélation pluie-paludisme** : les pics de cas confirmés coïncident avec la **saison des pluies** qui créent des **gîtes larvaires** favorables à la reproduction d'*Anophèles*.
- **Enfants <5 ans** : pics de cas et de décès alignés sur la période de fortes pluies.
- **Saisonnalité** : pics de pluie observés **chaque année entre juillet et octobre**.

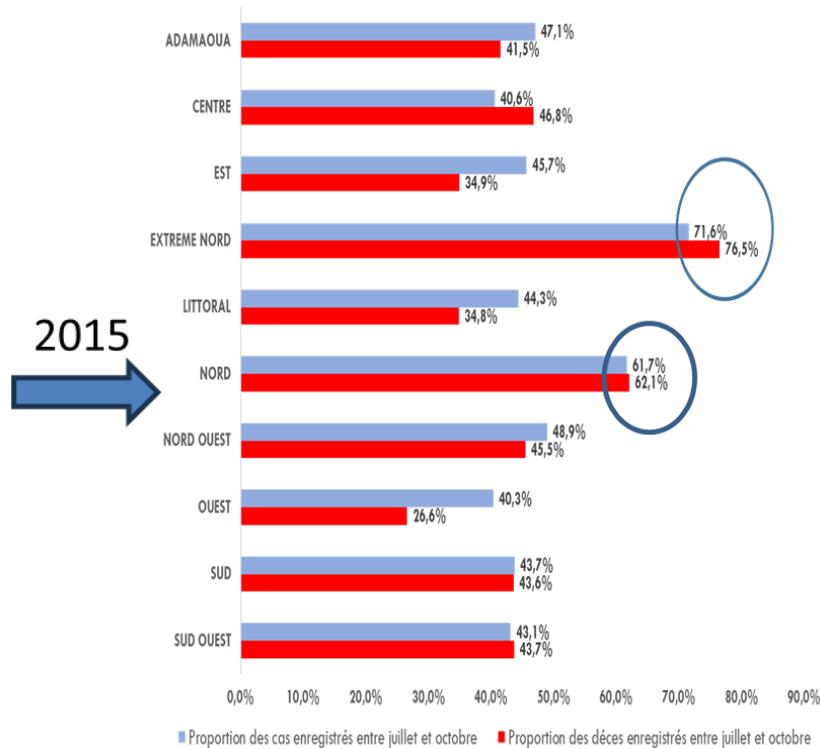

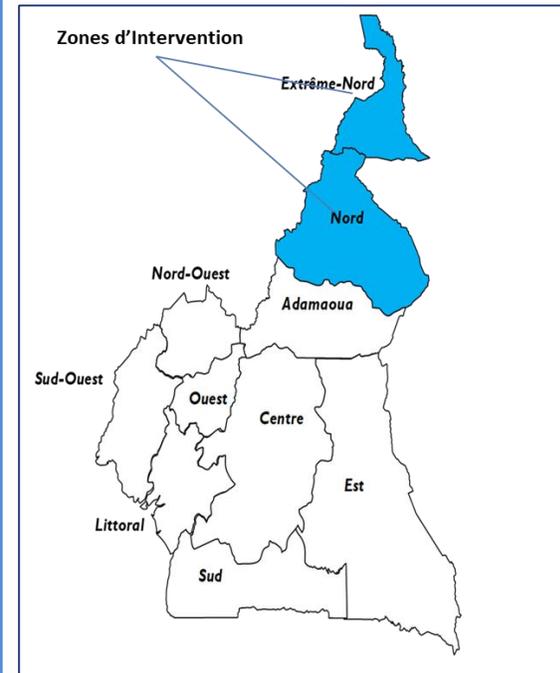

+

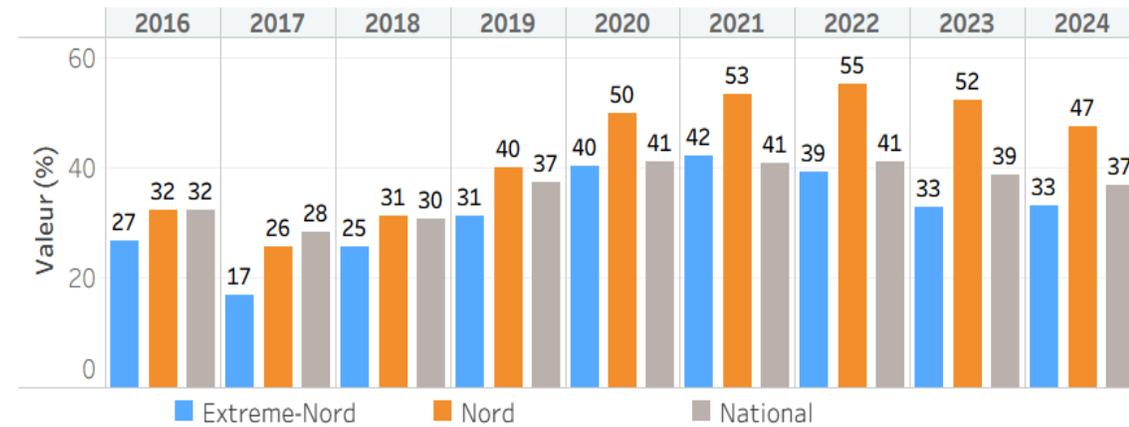

=

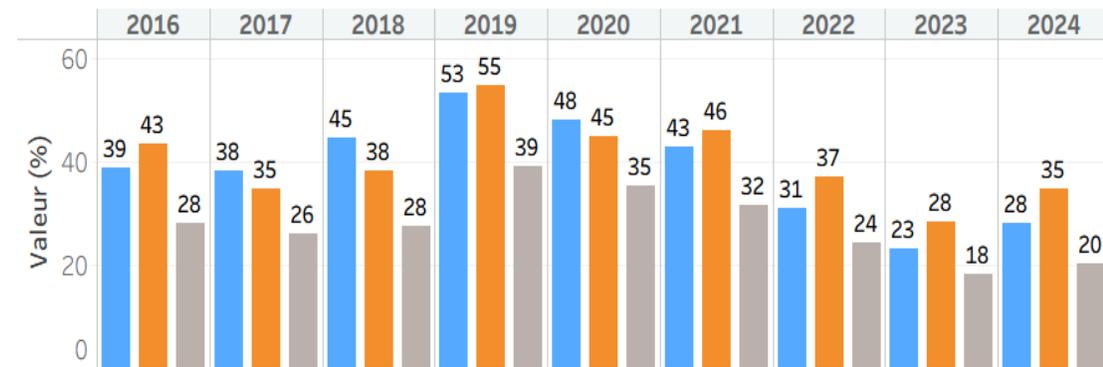

Introduction (3/4) : Critères d'éligibilité

Morbidité proportionnelle du paludisme chez les moins de 5 ans dans les régions du Nord et de l'Extrême-Nord

Mortalité proportionnelle du paludisme chez les moins de 5 ans dans les régions du Nord et de l'Extrême-Nord

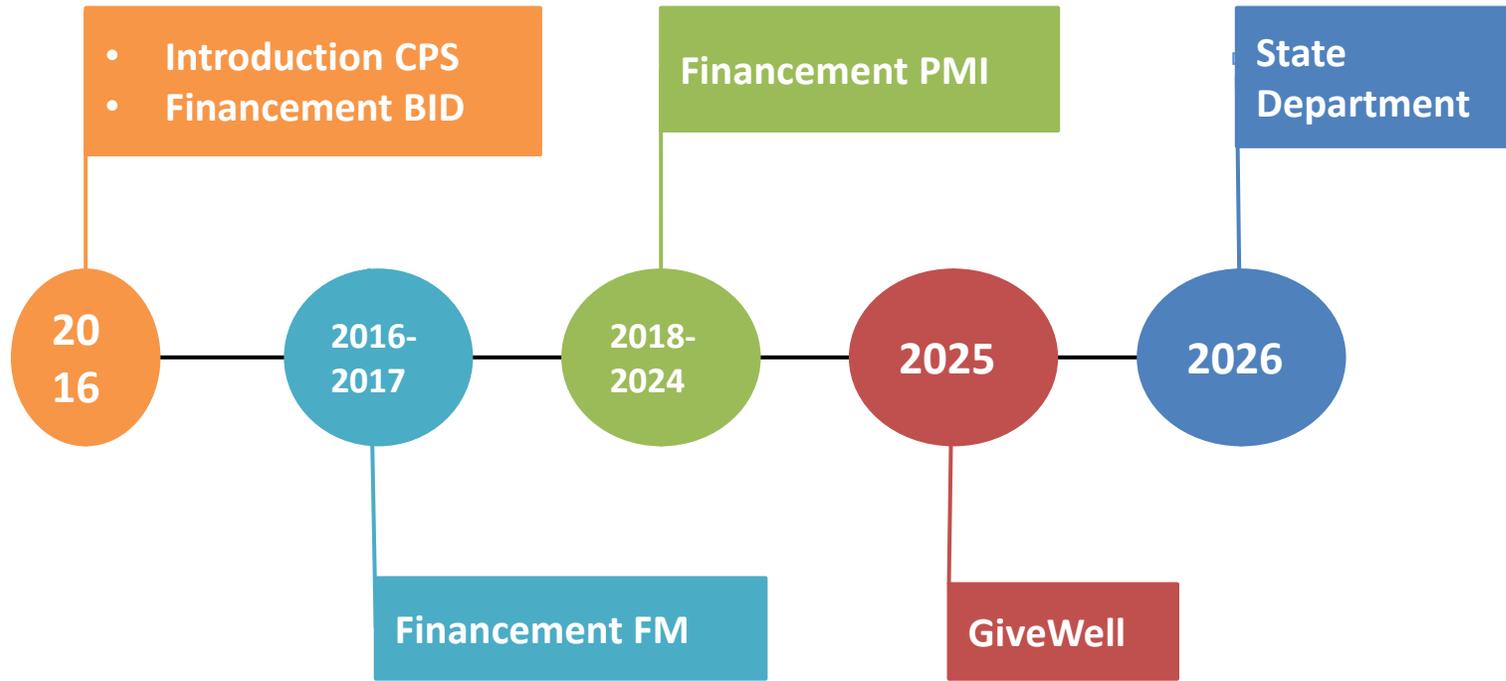

« La transmission du paludisme et la majorité (> 60 %) des cas cliniques de paludisme surviennent pendant une courte période d'environ 4 mois ;

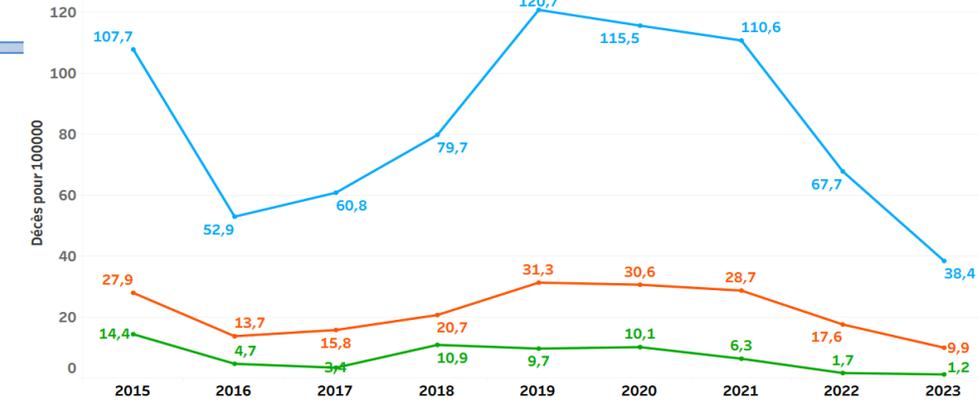

« Le taux d'attaque clinique du paludisme est supérieur à 0,1 attaque par saison de transmission dans le groupe d'âge cible ;

« Le SP + AQ reste efficace (> 90 % d'efficacité).

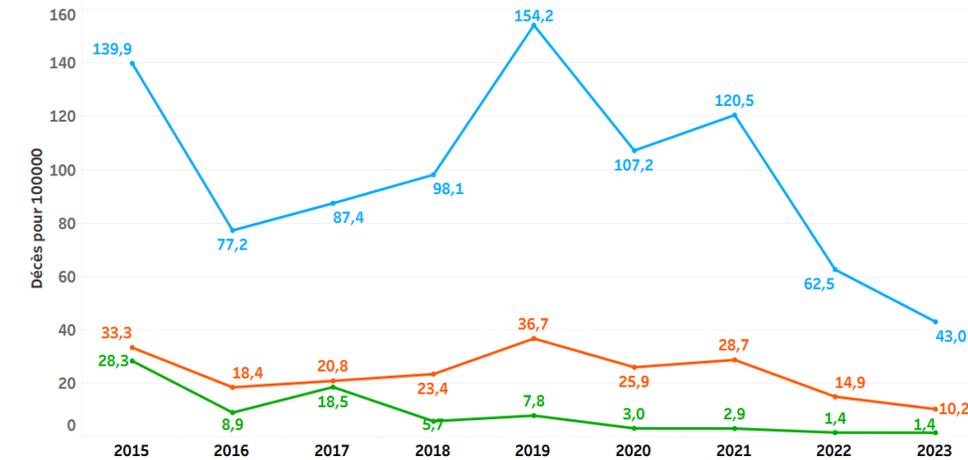

Contexte (1/4): Evolution des financements de la CPS au Cameroun

Evolution du taux de mortalité pour 100 000 par groupe cible - Extrême-Nord

Evolution du taux de mortalité pour 100 000 par groupe cible - Nord

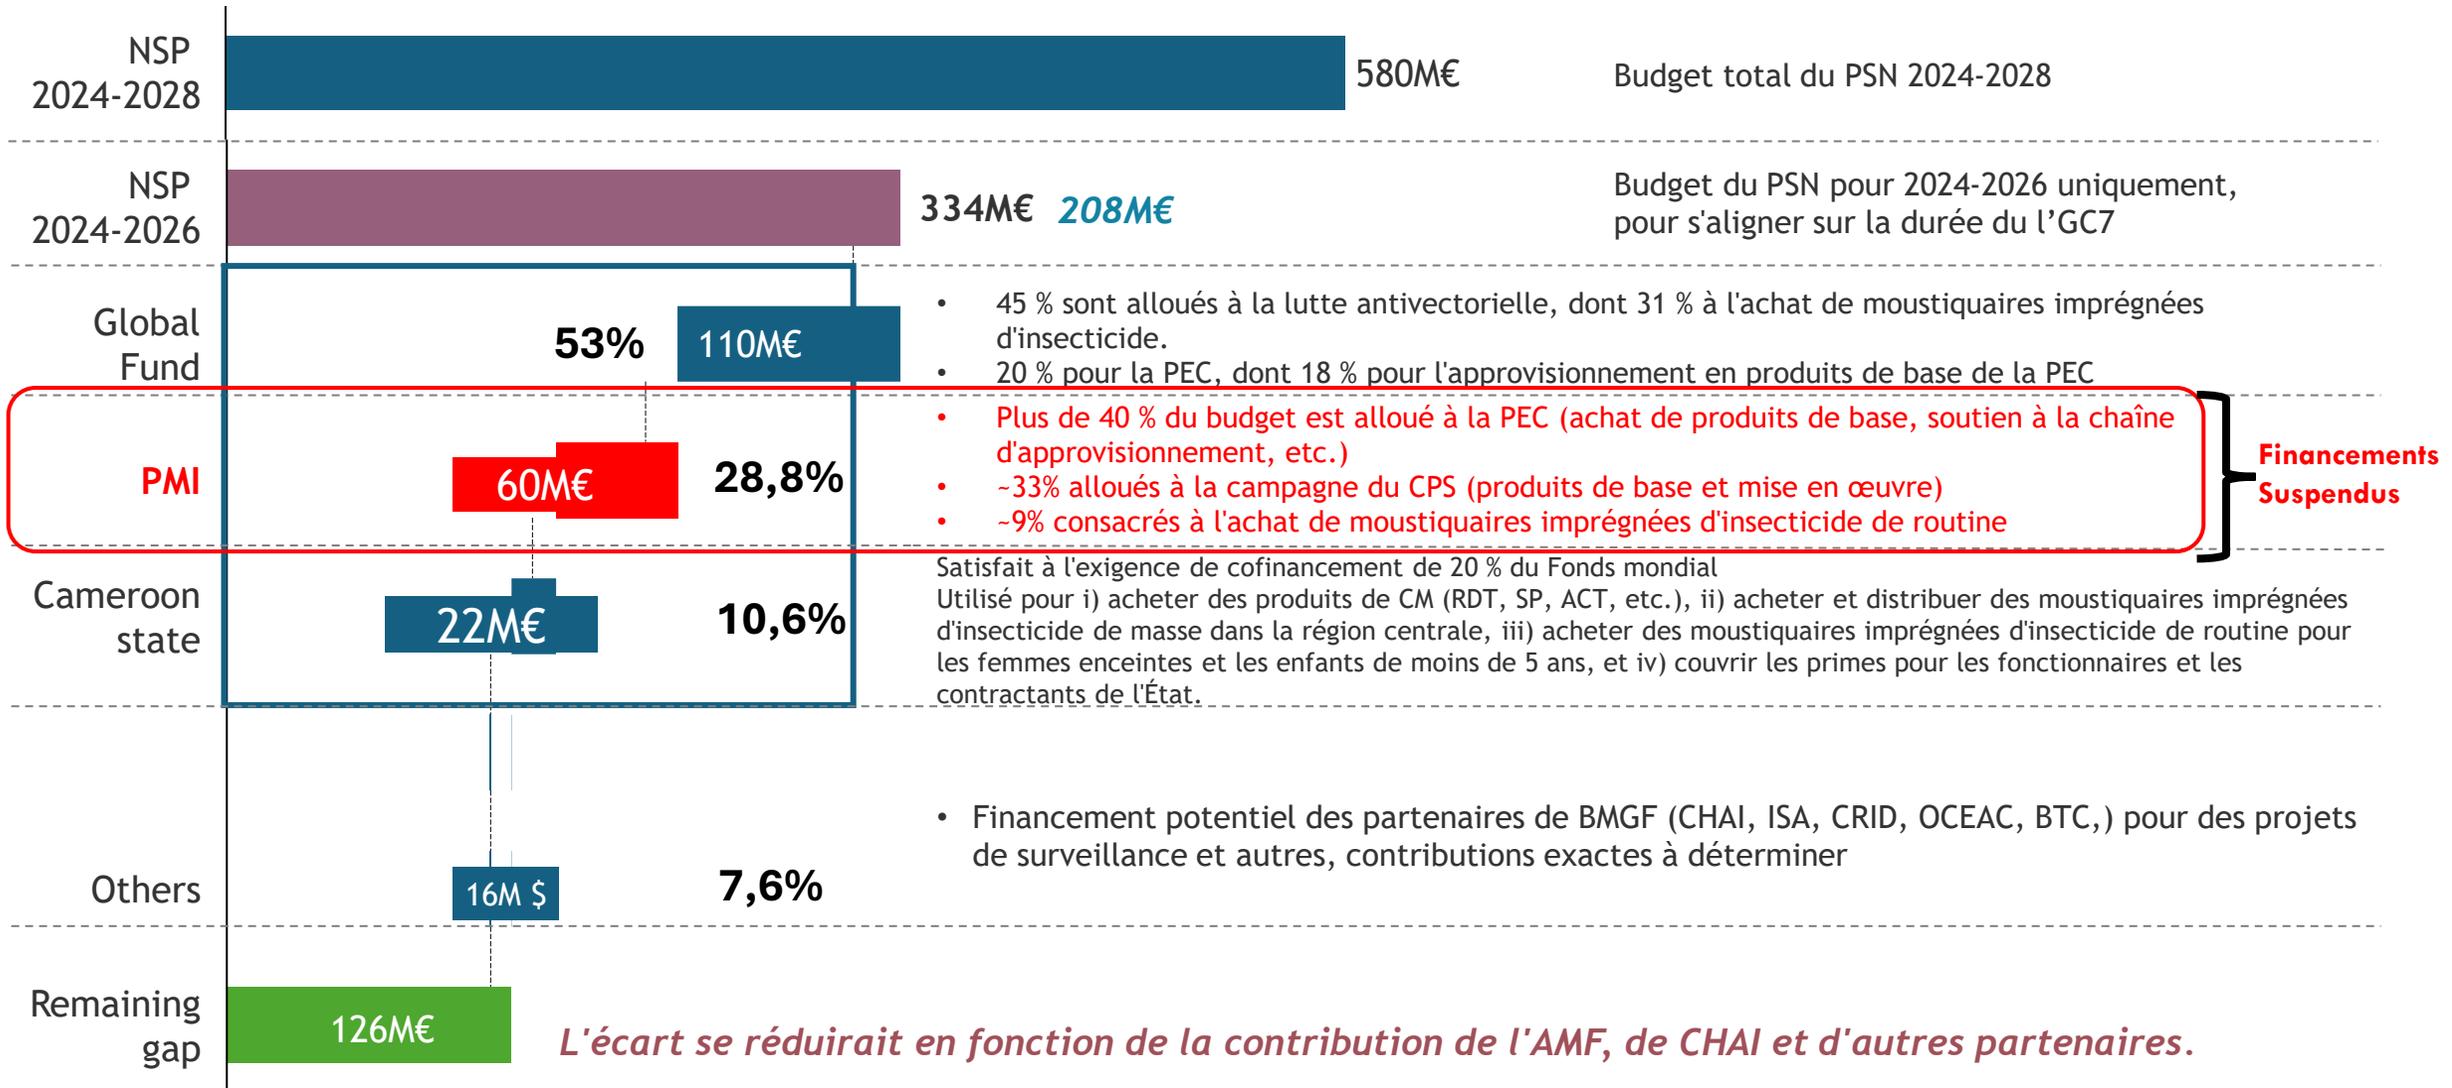

■ Taux de mortalité (Pour 100000) (< 5 ans)
■ Taux de mortalité (Pour 100000) (> 5 ans)
■ Taux de mortalité (Pour 100000) (Femmes enceintes)

- **2018-2024: >125 millions €** financements cumulatifs de PMI
- Baisse notable des décès chez les enfants <5 ans : **30%**(Extrême Nord); **44%** (Nord)

Réduction des financements, passant d'environ 3 millions € à 2,3 millions € en 2026

Contexte (2/4): Paysage du financement du PSNLP 2024 - 2026

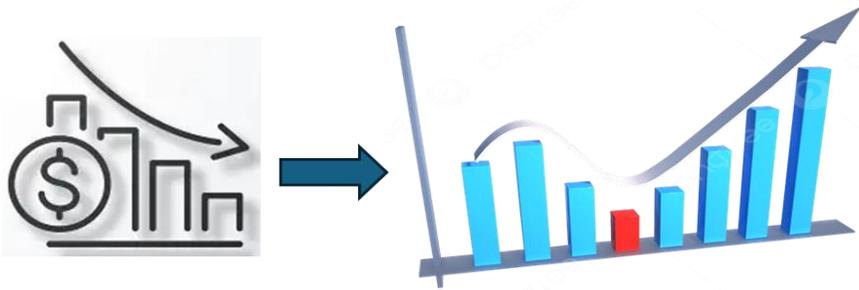

Contexte: Conséquences potentielles du gel des financements américains (3/4)

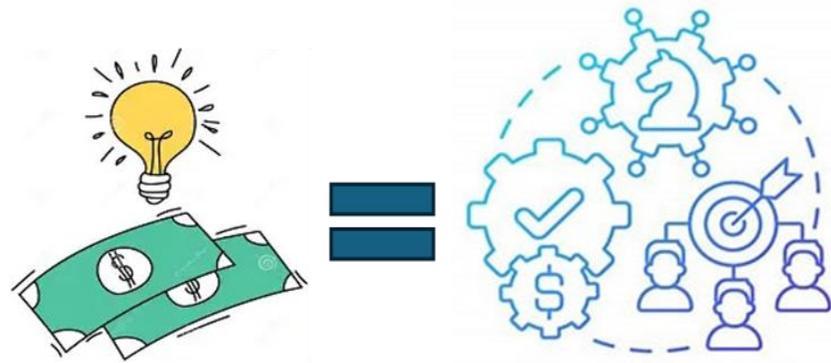

Menace sur la continuité des activités de lutte

L'arrêt prévu des financements PMI à partir de février 2025 aurait pu compromettre la disponibilité des services essentiels tels que la campagne de CPS, affectant fortement la santé publique dans ces régions.

Risque élevé de recrudescence des cas et décès

Sans le soutien financier, la progression réalisée depuis 2018 aurait été inversée, menaçant d'augmenter à nouveau le nombre de cas graves et de décès liés au paludisme chez les populations vulnérables.

Nécessité de stratégies alternatives

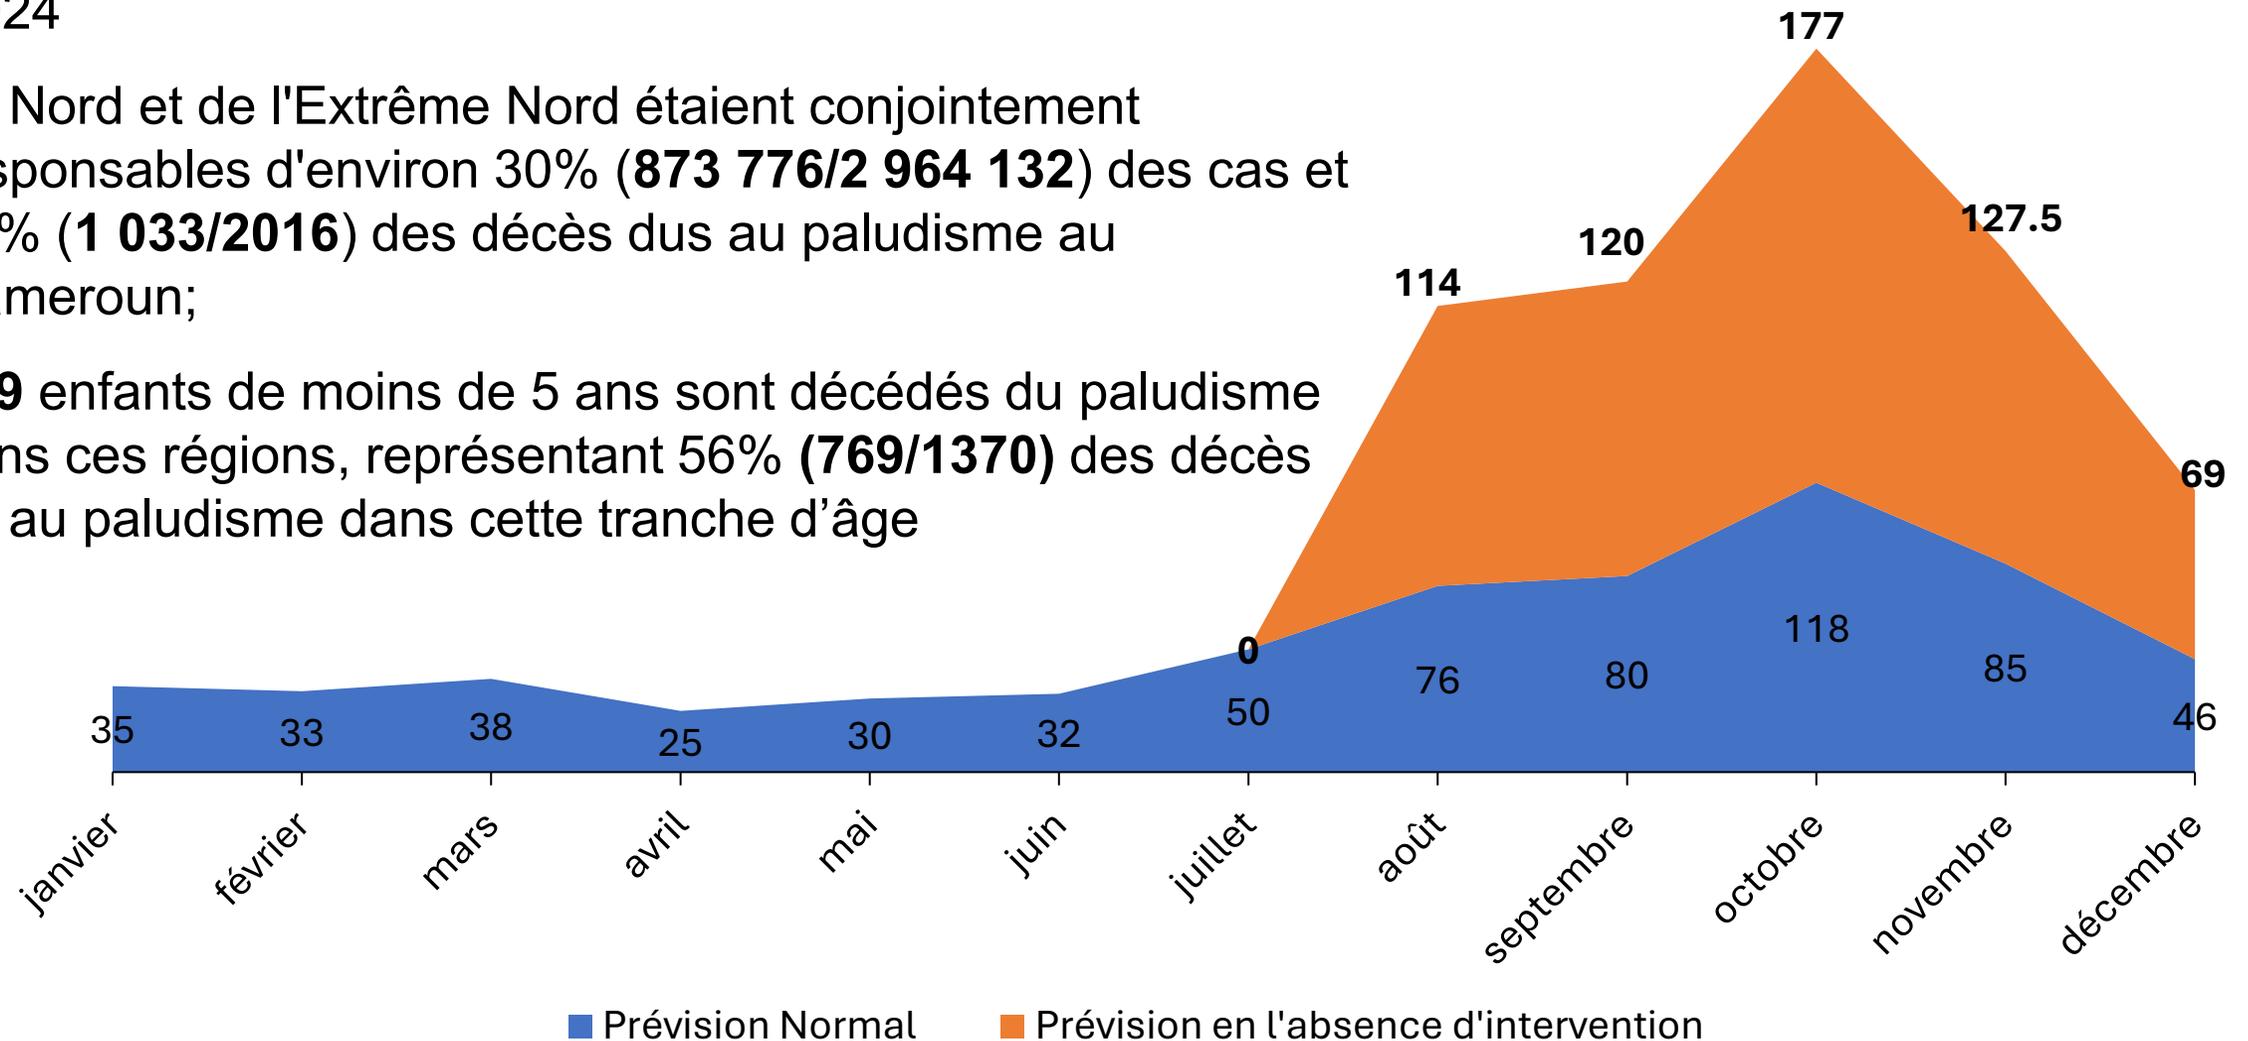

- Maintien des interventions essentielles
- Renforcement des capacités locales
- Mobilisation communautaire et partenariats
- Urgence d'élaborer des stratégies durables

STRATEGY

Contexte: Conséquences potentielles du gel des financements Américains: évolutions prévisionnelle des décès en 2025 (4/4)

En 2024

- Le Nord et de l'Extrême Nord étaient conjointement responsables d'environ 30% (**873 776/2 964 132**) des cas et 51% (**1 033/2016**) des décès dus au paludisme au Cameroun;
- **769** enfants de moins de 5 ans sont décédés du paludisme dans ces régions, représentant 56% (**769/1370**) des décès dû au paludisme dans cette tranche d'âge

Mesures de mitigation en contexte de financement limité: Planification (1/3)

01

Gouvernance

- Décision MINSANTE: Continuité des services
- Système de gestion d'incident

02

RH en santé

Maintien des Agents de santé communautaires

03

Produits de santé

- Redéploiement des intrants
- Suivi des commandes

04

Prestations de services

Continuité des services dans les formations sanitaires et en communauté

05

Information sanitaire

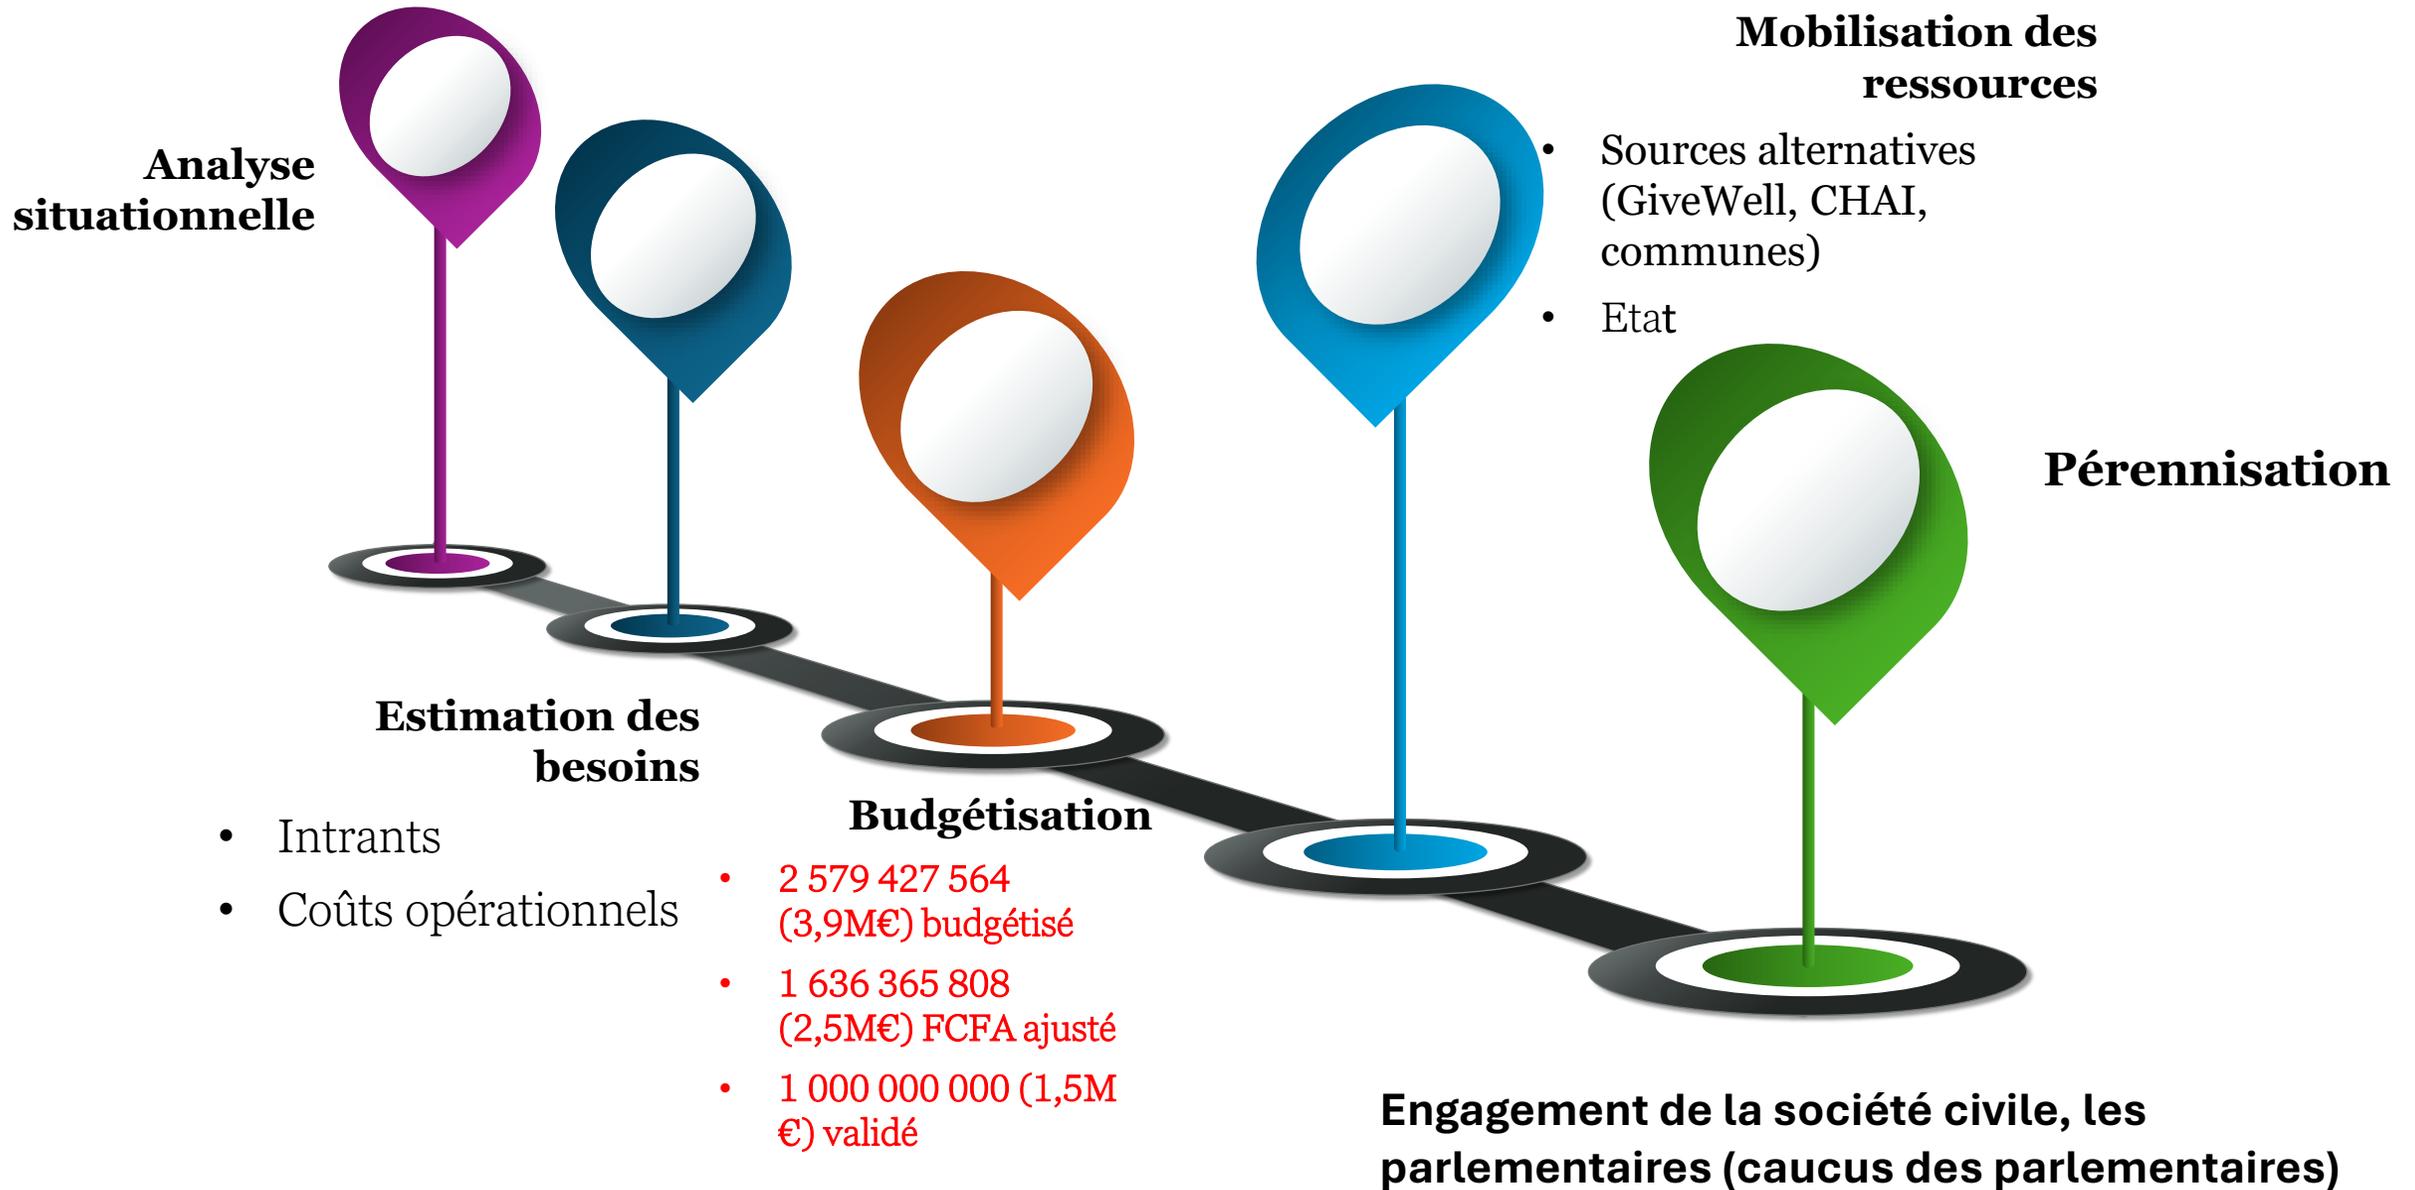

- Continuité des activités
- Transfert des bases de données

06

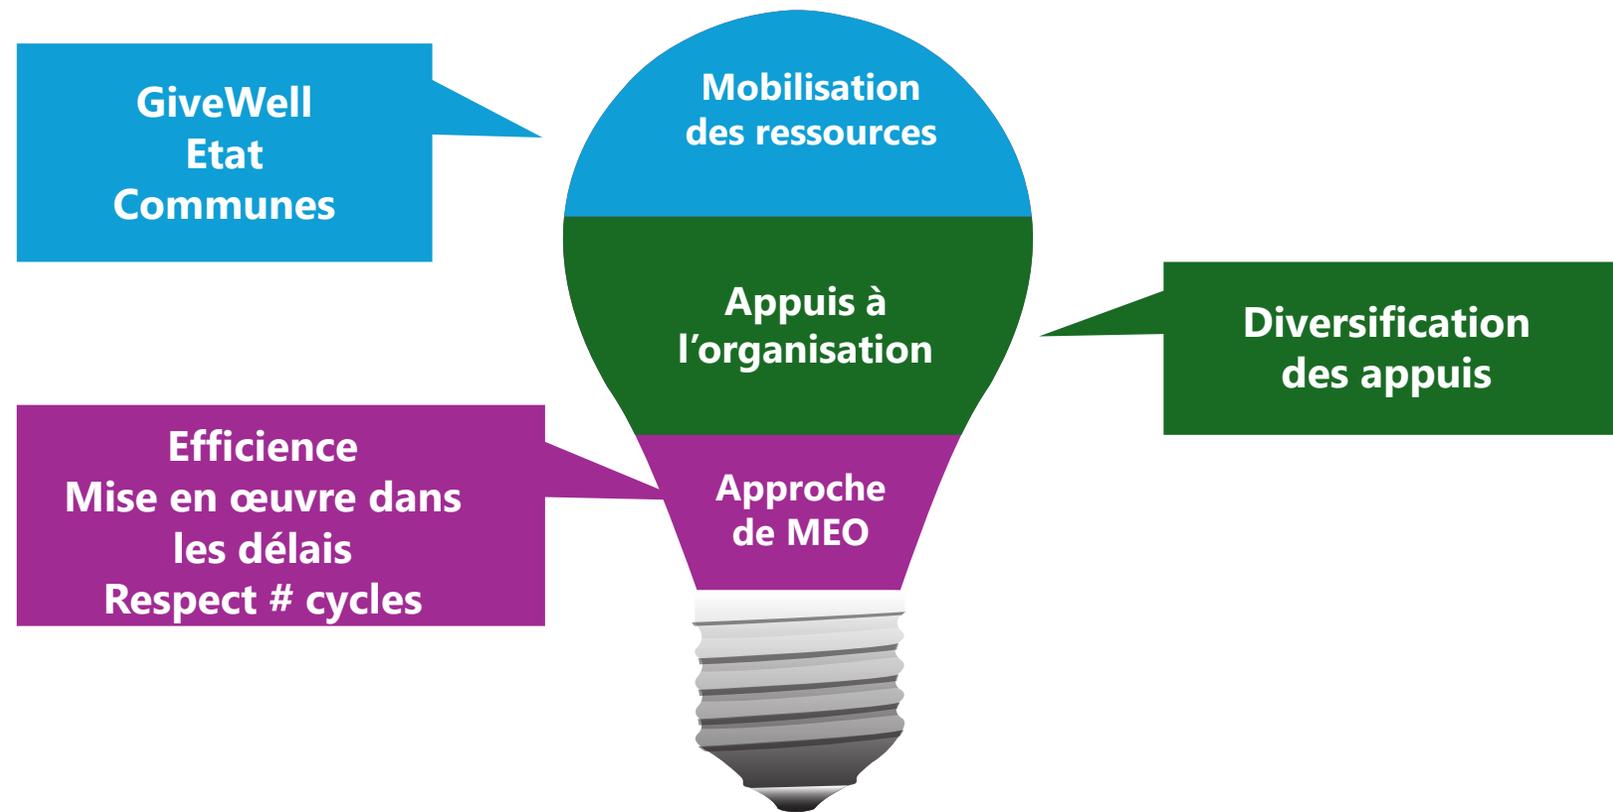

Financement

- Elaboration d'un plan de contingence budgétisé (Etat)
- Sources alternatives de financement (GiveWell, Communes)

Mesures de mitigation en contexte de financement limité: Planification (2/3)

Mesures de mitigation en contexte de financement limité: Résultats (3/3)

Couvertures optimales
89,5 % des enfants ont complété les 3 doses

Leçons apprises

- **La flexibilité programmatique/efficience est essentielle** pour maintenir la CPS en contexte de choc financier.
- **Les partenariats non traditionnels** (OSC, secteur privé) sont déterminants pour la continuité des interventions.
- **L'intégration progressive dans le système de routine** renforce la résilience et la durabilité de la CPS.

Conclusion

- Le contexte de financement limité a servi de catalyseur pour repenser la mise en œuvre de la CPS au Cameroun.
- Les adaptations mises en place ont permis d'assurer la continuité de l'intervention tout en posant les bases d'un **plan de pérennisation de la CPS à l'horizon 2030**, avec une intégration renforcée dans le système de santé de routine et une mobilisation accrue des financements domestiques publics et privés.

« Chaque franc investi dans la CPS génère un impact mesurable : couverture élevée, continuité des services, mobilisation domestique et apprentissages durables pour la pérennisation. »

Adaptation de la CPS 2025 au Niger face à la contrainte budgétaire : lignes directrices pour rationaliser les coûts et renforcer les résultats.

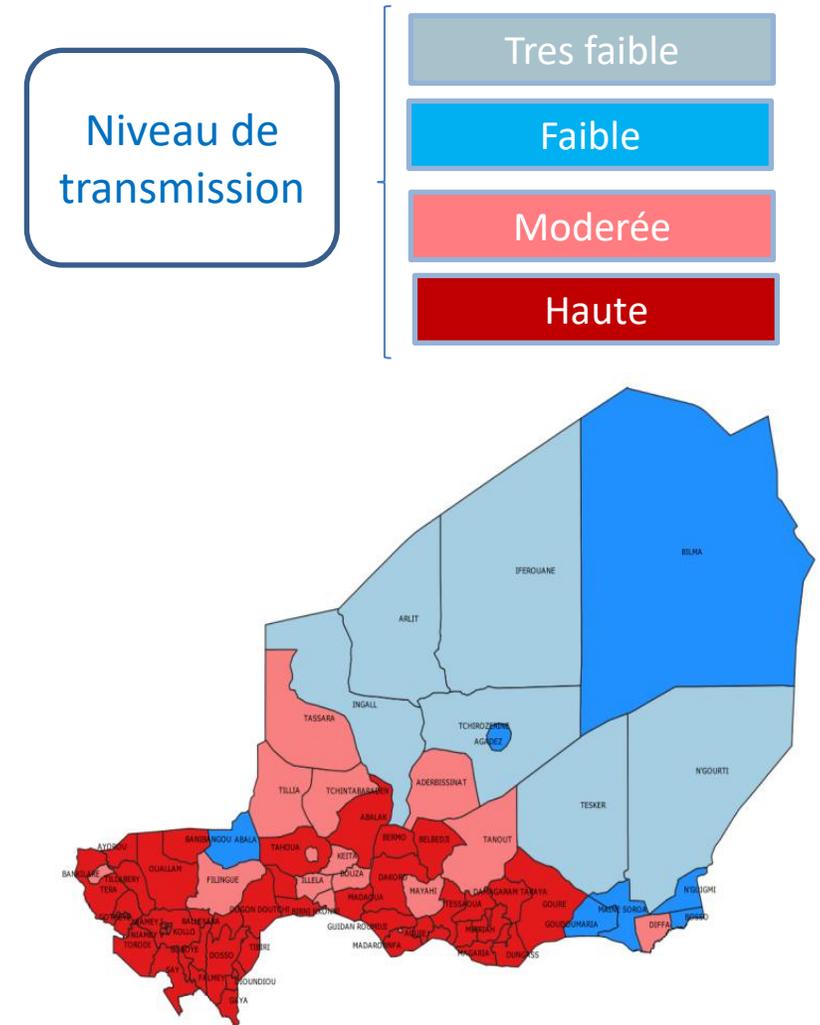

Plan de présentation

- I. Données générales**
- II. Adaptation de la CPS 2025 au Niger face à la contrainte budgétaire**
- III. Principaux Résultats**
- IV. Innovations**
- V. Conclusion/Recommandations**

I. Données générales

DONNEES GENERALES 2/2

- Pays HBHI, SaMe
- Principale morbidité et mortalité en 2024 avec 33,85% des cas, les enfants de moins de 5 ans représentent 47 % des cas.
- Principales victimes: enfants 0-59 mois avec 63% des décès et les femmes enceintes ;
- Le pic de transmission a lieu de juillet à octobre, corrélé à la pluviométrie
- Quatre strates épidémiologiques:
 - Très faible ;
 - Faible;
 - Modérée;
 - Haute .
- Principal espèce plasmodial : *P. falciparum* à 99,1 %;
- Principal vecteur de transmission : *An. gambiae* 98, 9%

II. Adaptation de la CPS 2025 au Niger face à la contrainte budgétaire

Rappel du contexte d'Adaptation

- Changements importants dans le paysage du financement externe des programmes de santé mondiaux, qui ont eu un impact considérable sur les services vitaux pour la lutte contre le Paludisme, la Tuberculose et le VIH et sur les systèmes de santé et communautaires.
- **Cas du Niger**: Réduction de l'allocation Fonds mondial GC7 (2024-2026) pour le reste de la période de mise en œuvre d'un montant de **4,602,457 euros** dont **805,201 euros (0.7% de l'allocation Paludisme)** pour le paludisme, impliquant la suppression de certaines activités (Mobilisation sociale CPS, Prise en charge de relais mobilisateurs CPS, leaders, formations..)

Adaptation 1/2

- Mobilisation du financement public pour couvrir 05 districts additionnels d'Agadez avec une couverture de 72/72 districts (coûts opérationnels 74M) ;
- Contribution communautaire : mobilisation sociale communautaire après la suppression de la composante « mobilisation sociale » : soutien des chefs traditionnels et religieux; relais mobilisateurs ;
- Contribution Communautaire pour la fourniture d'intrants après la suppression des indemnités journalières pour les agents et les chauffeurs chargés de l'approvisionnement ;

Adaptation 2/2

- Ratisage post-campagne basé sur une méthode d'échantillonnage suivant des données théoriques de consommation
- Inventaire post- campagne basé sur une méthode d'échantillonnage suivant les données de consommation théoriques
- Mutualisation de la supervision dans le cadre de l'OTSS (Outreach Training and Supportive Supervision) afin d'améliorer la qualité de la prise en charge des cas de paludisme dans les établissements de santé (cas simples, cas graves et paludisme pendant la grossesse), y compris le diagnostic biologique du paludisme.

III. Principaux résultats

Principaux Résultats 1/2

Tableau N° I : Enfants ayant reçu une CPS complète par district (3 ou 4 ou 5 passages)

| Districts | Dénominateur (Résultat 1er passage) | | | Résultats au dernier passage selon le cas (3 ou 4 ou 5 passages) | | | |
|--------------------|-------------------------------------|------------------|------------------|--|------------------|------------------|-------------|

| Niamey | 1 358 136 | 376 325 | 278 385 | 73,97% | |
| Tahoua | 4 125 009 | 766 696 | 645 611 | 84% | |
| Tillabéri | 797 943 | 154 410 | 123 902 | 80,24 | |
| Zinder | 5 340 677 | 1 254 027 | 1 033 304 | 82,40% | |
| Total | 16 354 600 | 4 282 254 | 3 400 963 | 79,42% | |

Conclusion/Recommendations

Conclusion/Recommandations

- Dans un contexte de changements permanents dans le paysage du financement externe des programmes de santé mondiaux, il est nécessaire de:
- continuer les efforts dans la mobilisation des ressources locales via l'organisation des activités de plaidoyer pour une plus grande implication des communautés dans la lutte contre le paludisme ;
- Identifier et mettre en œuvre des stratégies innovantes d'intégration des activités impliquant une réduction des coûts opérationnels et assurant l'impact

ITN campaign adaptations to work within a reduced funding environment

AMP Meeting 2026
Maximizing Impact, Minimizing Cost:
Lessons from an Optimised ITN
Mass Campaign, Pilot in Morogoro,
Tanzania

Peter Gitanya, NMCP

Monday, 24th February 2026

Classical TMC –implementation before optimization

- **Macroplanning**.... Physical meeting for 2 days
- **Microplanning**.....physical meeting for 3 days
- Logistics and supply chain management...retained by using a private or public organization. i.e. MSD
- **Training**... 2 days regional training, 3 days training, and 5 days wards training (cascade training model)
- **Data, supervision, and monitoring**. Using a digitalized system, for follow about 10 days
- **Social and behaviour change**.... Using private contractors, i.e., conduct PA and other community sensitization methods.

The Global Challenge – The "implementation cost" squeeze

Donor funding is plateauing

Traditional mass campaigns are effective but expensive and resource-heavy

The question: How do we maintain 80%+ ITNs access with shrinking budgets?

The “Optimization”

- Moving from “Business as usual” to “Lean & Efficient” but maintaining accountability
- In July 2025, a team of experts from NMCP and other stakeholders met to review and agree on the best possible way of optimising ITN Targeted mass campaign (TMC) implementation processes to reduce operational costs
- It was recommended to:
 - Continue with continuous distribution channel (RCH (ANC & EPI)
 - Implement and optimize TMC

Operational cost: modified mass campaign

| Activity | Initial costs | Optimized costs | Remarks |
|--|---------------|-----------------|---|
| Macro & micro quantification | 0.000 | 0.000 | |
| Planning & Coordination Meetings | 233 | 233 | |
| Advocacy Meetings (Regional & Council) | 508 | 508 | |
| CHMTs Training | 1,644 | | Removed 100% shift to virtual meetings |
| Ward level training | 4,442 | 4,442 | |
| Household Registration | 7,979 | | Removed 100% (modified registration approach) |
| Data entry and validation | | 2,793 | New activity |
| Pre-alert meetings | - | - | |
| Printing | 854 | | Already committed |
| ITNs issuing | 6,594 | 6,594 | |
| Community engagement | 4,970 | 1,242 | Reduced by 75% |
| Monitoring & Supervision | 6,009 | 3,004 | Reduced by 50% |
| Total per council | 33,132 | 18,816 | |

**43% reduction
after optimizing
the operations**

A case study of Morogoro – a pilot

- An optimised TMC is currently piloted in the Morogoro region
- Involving 7 high and moderate-malaria-burden councils
- Expecting to distribute **1,474,146 ITNs**
- HR (Data clerks) burden reduced by half, resulting in a huge cost saving

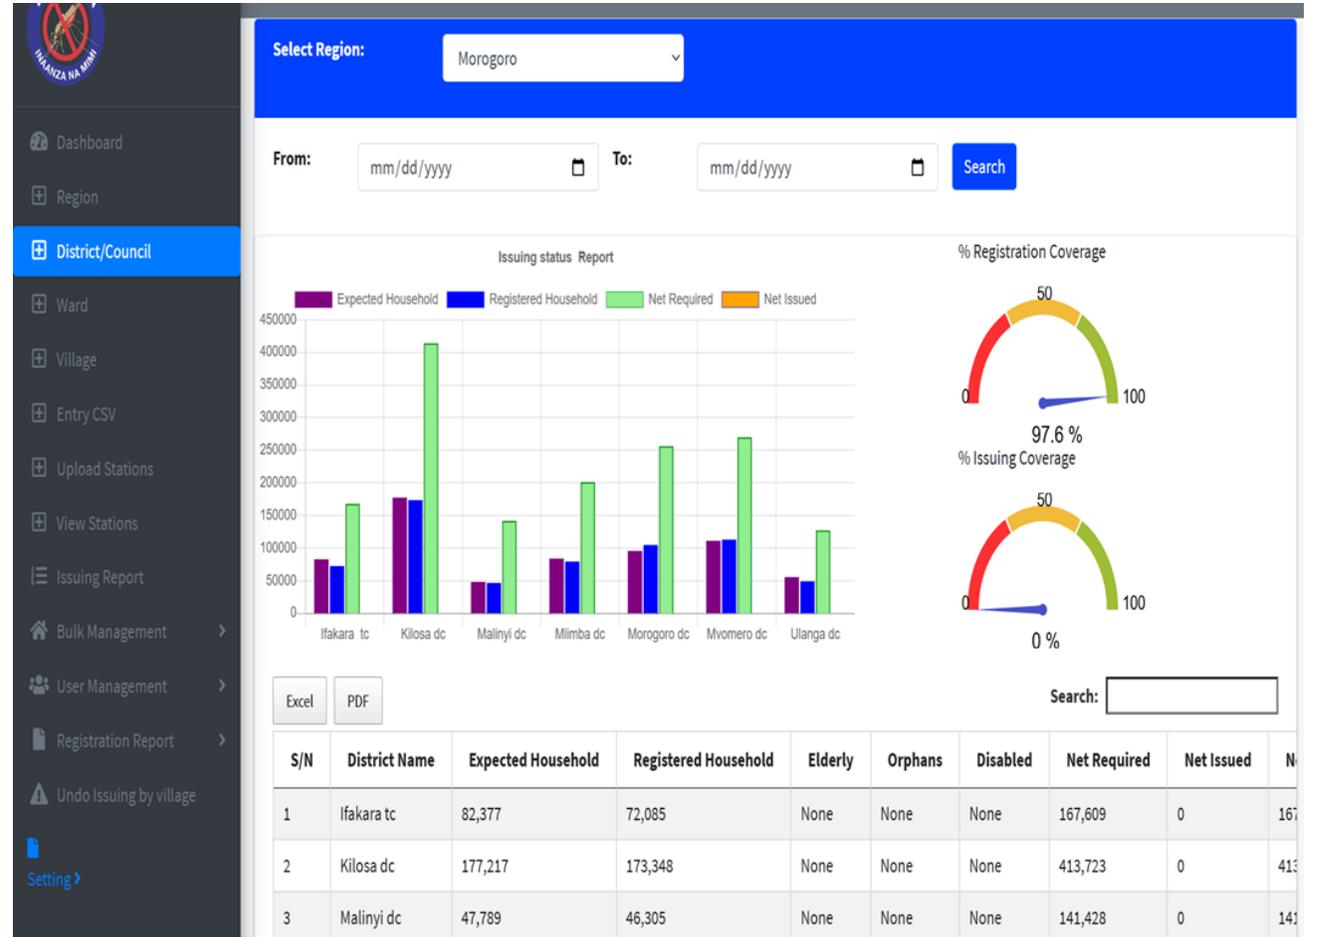

Expected coverage in Morogoro

| Sn | Council | Population | Households | Number of ITNs |
|----|--------------|------------------|----------------|------------------|
| 1. | Ifakara TC | 301,170 | 82,377 | 173,507 |
| 2. | Kilosa DC | 639,862 | 177,108 | 368,632 |
| 3. | Malinyi DC | 233,456 | 47,798 | 134,497 |
| 4. | Mlimba DC | 303,360 | 83,279 | 174,769 |
| 5. | Morogoro DC | 402,082 | 99,140 | 231,644 |
| 6. | Mvomero DC | 437,345 | 110,516 | 251,959 |
| 7. | Ulanga DC | 241,512 | 55,245 | 139,138 |
| | Total | 3,315,397 | 655,463 | 1,474,146 |

Household Registration as of 24th February 2026

- The optimization has not compromised the process
- Data for the households registration obtained from bulk registration after data collected by the village hamlets under the supervision of Village executive officers (VEOs) is submitted to the CHMT for data entry into the TMC-MIS
- Currently, the HHR is 97.6%

What worked really well

- Advocacy is very important, both at the regional and council levels, to get buy-in and ownership from the regional and council leaders
- District Human Resource Officers are very key in the mobilisation of the WEOs and VEOs to ensure campaign success
- Ward councillors are influential in the whole TMC implementation process, especially during household registration and ITNs issuing
- The use of local community leaders (e.g., Maasai) is very influential in their communities
- A good cooperation of the RHMTs and CHMTs has facilitated the household registration process

It wasn't all smooth

- Most villages lack proper household documentation, leading hamlet leaders to go door to door to obtain up-to-date data
- In some cases, WEOs and VEOs had to use their own money to pay hamlet leaders and others for data collection and entry
- Some community members refused to register because of beliefs and myths about nets
- There is also double work involved, registering households on paper and then transferring the data to a digital system
- In some villages, hamlet leaders called community members to register at the VEOs' office, which required long walks and led to low turnout

Recommendations

- Budget for data clerks is key to ensuring timely and quality data entry into TMC – MIS
- Optimisation requires more pre-planning time, but less execution time. Start organising data ahead of the implementation phase
- Local SBC is mandatory to get buy in of the community members

Wayforward

- With the support of PMI Evolve, NMCP, and MoH, we are upgrading the TMC – MIS to:
 - Host the optimized TMC module for easier data entry, synchronization, and visibility
 - A module to determine ITN access for the nets distributed through TMC

Thank you

2026 Joint SMC Alliance & AMP Meeting

Applying Cost Optimization Measures: What Worked and What Didn't Work

Presented by:

National Malaria Elimination Program

Nigeria

February 2026

Vision - a Malaria free Nigeria;

Goal – to achieve a parasite prevalence of less than 10% and reduce mortality attributable to malaria to less than 50 deaths per 1,000 live births by

2025

Outline

Introduction

Strategic planning and prioritization

Adapting campaign implementation

Resource optimization strategies

What worked and what didn't work

Introduction

- SMC and ITN campaigns are community-based and target children aged 3–59 months and households within the community.
- Malaria control efforts in Nigeria face major funding constraints due to declining global resources and increasing population to reach with interventions.
- Sustained commitment, innovative approaches, and integration into the broader health system are needed for malaria impact.
- Nigeria is continually exploring ways to enhance the efficiency of campaign implementation
- Integrated interventions can improve coverage, sustainability, comprehensive protection, and cost-effectiveness when well planned and implemented.

Strategic planning & prioritization

- Effective campaign implementation in the context of declining funding requires strategic planning, prioritization and flexibility, including assessing and optimizing campaign procedures and timelines
- Optimization considerations included:
 - Review the number of campaign implementation days
 - Reviewing campaign parameters (DP structure, CMD/CDD daily targets, number of town announcers, CMD supervisors, LGA teams, TTAs, and national oversight)
 - Scaling down of some campaign activities such as trainings, meetings and orientations
 - Deploying virtual platforms for trainings and meetings

Resource optimization strategies

Campaign Coordination

- Adjustments were made to most of the quantifications for campaign tools
- Some items were either removed/quantity adjusted/unit cost adjusted
- Number of security outfits reduced from 3 to 2 per LGA (police, civil defence, or vigilante as applicable within the LGA)
- Overall adjustment for all campaign personnel activity days for both national and state-level personnel to reflect the reduction in the number of campaign implementation day
- Out of station allowance adjusted to 50% across several state-level personnel

Waste management - EOLIN & ITN waste

- Cost reduced from N4,000 to N3,000 per distribution point

Adapting campaign implementation

Trainings

- National Training of Trainers was changed from in-person to virtual
- State level and LGA level training was reduced from 2 days to 1 day
- CMD training days reduced from 5 to 2 (1 day per batch of CMDs)
- LGA team participants reduced from 5 to 4 people, to include the LGA malaria focal person, logistician, health educator and M&E officer
- Cost of stationaries for participants was removed
- LGA TAs and TTAs training changed from in-person to virtual
- Training of DP supervisors was removed and role of DP supervisor merged with either the DP recorder or DP distributor
- Distribution point team training days reduced from 2 to 1 day

Adapting campaign implementation

Household mobilization/SPAQ administration

- Days for household mobilization and SPAQ administration reduced from 5 to 4 days
- Daily target increased from 65 to 100 children per day
- This helped to reduce the number of CMDs and TTAs significantly

ITN distribution

- ITN distribution reduced from 5 to 4 days
- DP target adjusted from 1500 to 3000/300 to 750 ITNs per day
- Reduced the number of DPs and DP personnel

Resource optimization strategies

SBC Activities

- Participants reduced from 2 reps per CSO to 1 rep per CSO and days reduced from 2 to 1 day
- Orientation session with community leaders, religious/traditional leaders, school health coordinators, and union leaders was removed
- Media parley was removed → should be funded by the state
- Orientation removed → should be funded by the state including the ICCC review meetings
- Number of town announcers reduced from 4 to 2 ward supervisors, and 10 working days.

ITN Logistics

- Role of LGA conveyors was removed as well as cost of the orientation
- Transporter engaged by the 3PLs through the 4PLs will ensure accountability of the ITNs through the supply chain

Resource optimization strategies

Campaign Monitoring and Supervision

- CMD supervisors was adjusted from 1 per 5 CMD teams to 1 per ward
- Supervision process strengthened with the use of technology for a data-driven monitoring process
- Campaign Monitoring Team (CMT) was reduced from 3 per LGA to 2 per LGA
- Cycle 1 end of round assessment was removed → leverage the end process assessment for ITN campaigns and expand the scope to cover the SMC component

Results of adaptation & optimization measures

For Kaduna campaign, following the adaptation and optimization of the campaign processes, restructuring of personnel lead to the reduction in overall personnel from 29,433 to 19,863

The team was able to review the campaign budget **from \$3,913,229 (N4,695,875,356) to \$1,771,902 (N2,126,281,917)**

This resulted in a budget efficiency of **\$2,141,328 (N2,569,593,439) (54%)**.

Additionally, there was an overall 10% savings on the Kaduna budget from the approved grant budget

Sustained coverage for both interventions despite limited funding

Reduction in the overall number of implementation days from 42 to 28

What worked

- Effective coordination due to stakeholders collaboration and commitment at national and state level
- Strategic planning and prioritization helped adapt campaigns to a declining funding landscape
- Use of virtual platforms for trainings and meetings reduced expenses while maintaining strong coordination
- Personnel restructuring (e.g., Kaduna State workforce reduction) lowered operational costs.
- Resource optimization measures such as reviewing CMD/CDD targets and quantification parameters

Vision - a Malaria free Nigeria;

Goal – to achieve a parasite prevalence of less than 10% and reduce mortality attributable to malaria to less than 50 deaths per 1,000 live births by

2025

What didn't work

- Scaling down trainings, meetings, and orientations, while cost-saving, resulted in:
 - ✓ Sub optimal understanding of training modules due to limited training time
 - ✓ Weaker supervision in some areas reduced implementation quality
- Following adjustments, distribution point personnel were too low, and daily targets were significantly too high
- Reduced number of distribution points caused a low turn out of beneficiaries in some DPs due to distance.
- Mismatch between resources deployed and actual field needs in some areas and more resources were required
- Personnel reductions and compressed timelines overburdened remaining staff due to high targets
- Low morale of campaign personnel

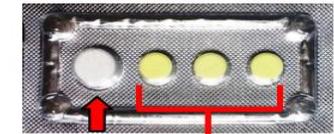

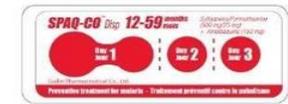

Conclusion

For future campaign implementation, there is need to;

- Streamline campaign operations and processes to ensure reduced cost without compromising quality and impact
- Utilize technology to optimize resources
- Explore opportunities to integrate with other health interventions
- Continue to document lessons learned for improved campaign implementation

SP AQ

Key partners and stakeholders

Thank you for your time and attention!

**Assemblée annuelle des partenaires de l'Alliance pour la Prévention du Paludisme (APP)
2026**

**OPTIMISATION DES COUTS OPÉRATIONNELS POUR LA CDM, LES LEÇONS APPRISSES ET LES
RECOMMANDATIONS POUR LE FUTUR**

UGANDA DU 24 au 27 Fév 2026

PRINCIPAUX RESULTATS DE LA CDM

| INDICATEURS | QUANTITE | COUVERTURE |
|---|------------|---|
| Populations dénombrées | 27 491 694 | |
| Ménages théoriques | 6 246 092 | |
| Ménages dénombrés | 7 298 236 | 116,8 % (taille moyenne = 3,8) |
| Ménages ayant reçus leurs MILDA | 7 070 525 | 96,9 % |
| MILDA prépositionnées | 14.828.137 | 92% du stock disponible |
| MILDA disponibles pour la distribution | 16.084.580 | |
| Nombre de MILDA distribuées aux ménages | 14 763 528 | soit plus de 99% du stock prépositionné |
| Stocks restant en fin de campagne | 1.337.147 | 8,31% du stock disponible |
| Nombre de gites larvaires identifiées | 3 051 396 | |
| Nombre de gites larvaires détruits | | 86,95% |
| Public | 2 622 903 | |

DIFFICULTES MAJEURES ET IMPACT SUR LA CDM

- ❖ Campagne nationale : 16+ millions de MILDA
- ❖ Couverture optimale à maintenir
- ❖ Contexte sécuritaire complexe
- ❖ Des retards de livraison des MILDA dans les zones à haut défi sécuritaire
- ❖ Arrivée tardive de certains stocks de MILDA dans le pays MILDA PMI/USAID (750 000 MILDA)
- ❖ Incertitudes de financement (PMI / USAID)
- ❖ Réduction drastique des coûts opérationnels par le FM (environ 40%)
- ❖ Suppression de certaines activités

Question centrale :

Comment préserver l'impact sanitaire tout en maîtrisant les coûts ?

Principaux moteurs de coûts

❖ Logistique & transport

❖ Ressources Humaines

❖ Adaptations sécuritaires: détours logistiques, stocks tampons

❖ Supervision

Ces éléments représentent les principaux moteurs d'escalade budgétaire

Ce qui a amélioré l'efficacité

- Stratification des approches
- Reamenagement budgétaire
- Redimensionnement des équipes et rationalisation des activités
- Renforcement de la coordination
- Priorisation des zones à défis sécuritaires dans la livraison des MII aux pays, associée à l'initiative des entrepôts tampons, a favorisé l'approvisionnement en MII et la mise en œuvre de la distribution dans ces zones.

DIFFICULTES ET APPROCHES D'OPTIMISATION

| N° | ELEMENTS | ADAPTATION |
|----|---|--|
| 1 | Les mesures restrictives du Fonds Mondial (réduction drastique des coûts opérationnels environ 42%) | <ul style="list-style-type: none"> ✓ Révision des stratégies ✓ stratification, ✓ distribution porte à porte ✓ Dénombrement/distribution communautaire <hr/> <ul style="list-style-type: none"> ❖ REDIMENSIONNEMENT DES EQUIPES <ul style="list-style-type: none"> • 40 ménages/jour/Eq en milieu urbain au lieu de 30 • 30 ménages/jour/Eq en milieu rural au lieu de 25 <hr/> <ul style="list-style-type: none"> ❖ RATIONALISATION DE LA CHARGE DU TRAVAIL DES EQUIPES <ul style="list-style-type: none"> • 4 volontaires/site en milieu urbain au lieu de 6 • 3 volontaires/site en milieu urbain au lieu de 4 • Forfait de 10 jours distribution communautaire |

DIFFICULTES ET APPROCHES D'OPTIMISATION

| N° | ELEMENTS | ADAPTATION |
|----|---|---|
| 2 | <ul style="list-style-type: none"> ❖ Retard dans l'allocation des ressources pour l'exécution des activités ❖ Incertitude financement (PMI/ USAID) ❖ Suppression d'activités (du monitoring indépendant, Plaidoyers (central , régional Districts et CSPS dotation en mégas pour la connexion) ❖ Coûts élevés du transports des MILDA dans le zones à défis sécuritaire ❖ Arrivée tardive des MILDA de PMI (750.000) | <ul style="list-style-type: none"> • Réaménagements budgétaires • Réduction durée des formations de 1 à 2 jours • Réduction durée supervision de 5 jours • Réduction du nombre de superviseurs • Diminution du nombre des participants aux formations • Reduction du nombre des ateliers • Recours à d'autres PTF • Recours au budget de l'Etat • Utilisation de l'URL Free pour palier au manque de mégas <hr/> <ul style="list-style-type: none"> ❖ Renforcement de collaboration, mobilisation de ressources locales • Intégration à des convois militaires • Transports aériens dans certaines zones • Participation des communautés dans le transport des MILDA • Implication ONG humanitaires • Priorisation de livraison dans les zones à défis sécuritaires • Entrepôts tampons |

STRATIFICATION DU TERRITOIRE ET APPROCHES DE DISTRIBUTION CDM 2025

Approches de distribution

Stratification et approche

| Strates | Milieux urbains (Ouaga et Bobo) I | Autres Milieux urbains à sécurité stable II | Autres Milieux urbains à Forts défis sécuritaires III | Milieu rural à sécurité stable IV | Autre Milieu rural à Forts défis sécuritaires V |
|---|--|--|--|--|---|
| Stratégies de dénombrement/ distribution | Distribution couplée au dénombrement de porte à porte AVEC site de distribution (distribution au lendemain du dénombrement) | Distribution en SF décalée de 4 semaines du dénombrement par porte à porte | Distribution couplée au dénombrement de porte à porte SANS site de distribution (MILDA remise aux ménages par les EPP) | Distribution en SF décalée de 4 semaines du dénombrement par porte à porte | Distribution communautaire |
| Total DS/strate | 7 | 26 | 13 | 37 | 29 |

Caractéristiques des strates et approche de distribution

| ELEMENTS | APPROCHE | STRATE | DUREE |
|----------------------------|--|---------------------|--|
| Dénombrement | Porte à porte | 1, 2, 3 et 4 | 15 jours |
| Distribution | Site fixe - 3000 ménages en zone urbaine - 1200 en zone rurale | 1, 2 et 4 | - 15 jours = strate 1 - 6 jours = strate 2 et 4 |
| Dénombrement /distribution | Porte à porte | 3 et 5 | 15 jours |
| Dénombrement /distribution | communautaire | 5 | 10 Jours |

plusieurs villages/secteurs de moins de 1200 ménages pourraient avoir un même site de distribution

OPTIMISATION DANS UN CONTEXTE DE RESSOURCES LIMITEES

| ELEMENTS | MONTANTS (CFA) | MONTANTS (dollars) |
|-------------------------------------|----------------------|---------------------|
| Budget initial | 9 604 747 727 | 16.558.910 |
| Budget révisé | 7 673 369 495 | 13.229.947 |
| Budget exécuté | 5 542 420 354 | 9.555.897 |
| Ecart (reduction de 42,30%) | 4 062 327 373 | 7.004.013 |

Principales leçons apprises

| N° | Leçons apprises |
|----|--|
| 1 | Explorer l'utilisation des opportunités qu'offrent les TIC (visioconférence) pour la tenue des sessions des instances de coordination. |
| 2 | Redimensionner certains ateliers d'élaboration des documents en y favorisant les sessions internes de mise à jour des documents et le travail en mode virtuel. Cela permettra d'affecter les ressources disponibles aux activités essentielles de terrain. |
| 3 | Rendre obligatoire l'évaluation préalable des capacités de stockage des districts avant l'acheminement des MII, afin de réduire les pertes, les surcoûts logistiques et les retards de distribution. |
| 4 | Veiller à reproduire les outils 6 à 12 mois avant le dénombrement/distribution tout en s'assurant de leur qualité. |
| 5 | Piloter une approche "Bring Your Own Device (BYOD)" (apporter votre propre appareil) dans des zones sélectionnées, afin de réduire les coûts et renforcer l'appropriation des outils numériques par les acteurs opérationnels. |

Principales leçons apprises

| N° | Leçons apprises |
|----|---|
| 6 | La priorisation des zones à défis sécuritaires dans la livraison des MILDA aux pays, associée à l'initiative des entrepôts tampons a favorisé l'approvisionnement en MILDA et la mise en œuvre de la distribution dans ces zones. |
| 7 | Intégrer un scénario sécuritaire dans les budgets |
| 8 | Budgétiser la digitalisation comme investissement avec ligne dédiée |
| 9 | Planifier la logistique inverse dès le départ |
| 10 | Impliquer les communautés à la mise en œuvre de la CDM permet de mobiliser des contributions en ressources financières, humaines et matérielles utiles à la réalisation de certaines activités (transport des MII, équipes supplémentaires de volontaires). |

DEFIS MAJEURS DE LA LUTTE ANTI VECTORIELLE AU BURKINA FASO

- ❖ Gestion de la résistance des vecteurs aux insecticides
- ❖ Surveillance de anopheles stephensi
- ❖ Mobilisation accrue des ressources endogènes
- ❖ Le maintien de l'accès de toutes les populations aux MILDA dans un contexte d'insécurité
- ❖ Quantification des MILDA et des ressources humaines nécessaires pour les approches de distribution en porte
à porte

conclusion

- Malgré les énormes difficultés rencontrées, la CDM 2025 est restée marquée par un succès rendu possible par des facteurs dont les plus plausibles sont :
- L'engagement très appréciable des acteurs à tous les niveaux du système de santé sous l'impulsion des nouvelles autorités et sous le remarquable leadership du SP/Palu avec le soutien indéfectible des PTF ;
- Le parfait attelage entre la forte capacité de résilience et l'engagement patriotique des acteurs nationaux les amenant à faire plus avec peu de ressources.
